

When  $n_a > n_b$ ,  $P'$  is closer to the surface than  $P$ ; for  $n_a < n_b$ , the reverse is true.

Q34.5

For the two examples, is the image real or virtual?

When  $n_a > n_b$ ,  $P'$  is closer to the surface than  $P$ ; for  $n_a < n_b$ , the reverse is true.

- A. real in both cases
- B. virtual in both cases
- C. real for the water and virtual for the mirror
- D. virtual for the water and real for the mirror

For a plane mirror,  $PQV$  and  $P'Q'V$  are congruent, so  $y = y'$  and the object and image are the same size (the lateral magnification is 1).

An image made by a plane mirror is reversed back to front: the image thumb  $P'R'$  and object thumb  $PR$  point in opposite directions (toward each other).

Image of object  $P$   
formed by mirror 1

Image of *image*  $P'_1$   
formed by mirror 2

(a) Construction for finding the position  $P'$  of an image formed by a concave spherical mirror

For a spherical mirror,  
 $\alpha + \beta = 2\phi$ .

$s$  and  $s'$  are  
both positive.

Note typo in book!

The beige and blue triangles are similar, so the lateral magnification is  $m = y/y' = -s/s'$ . The negative value of  $m$  means that the image is inverted.

(a) Construction for  $s = 30$  cm

(b) Construction for  $s = 20$  cm

(c) Construction for  $s = 10$  cm

(d) Construction for  $s = 5$  cm

Q34.6

An object is placed 0.5 m away from a concave mirror of focal length +1.0 m. The image formed by the mirror is

- A. real and larger than the object.
- B. real and smaller than the object.
- C. real and the same size as the object.
- D. virtual and larger than the object.
- E. virtual and smaller than the object.

(a) Construction for finding the position of an image formed by a convex mirror

(b) Construction for finding the magnification of an image formed by a convex mirror
