## Cover Picture

Wenhua Chen\*, Quantong Shen, Robert A. Bartynski,  
Payam Kaghazchi, and Timo Jacob

Surface faceting is used to prepare a nanoscale model Ir catalyst. The cover picture illustrates a schematic of the faceting process on Ir(210) and single three-sided pyramid on faceted Ir(210) exposing (311), (31 $\bar{1}$ ) and (110) facets. Clean planar Ir(210) and clean faceted Ir(210) are then used to study reduction of NO by CO as described on p. 2515 by W. Chen et al.
