WARRANTY SUMMARY
(TDS1000- and TDS2000-Series Digital Storage Oscilloscope)

Tektronix warrants that the products that it manufactures and sells will be free from defects in materials and workmanship for a period of three (3) years from the date of shipment from an authorized Tektronix distributor. If a product or CRT proves defective within the respective period, Tektronix will provide repair or replacement as described in the complete warranty statement.

To arrange for service or obtain a copy of the complete warranty statement, please contact your nearest Tektronix sales and service office.

EXCEPT AS PROVIDED IN THIS SUMMARY OR THE APPLICABLE WARRANTY STATEMENT, TEKTRONIX MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT SHALL TEKTRONIX BE LIABLE FOR INDIRECT, SPECIAL OR CONSEQUENTIAL DAMAGES.
Tektronix warrants that the products that it manufactures and sells will be free from defects in materials and workmanship for a period of one (1) year from the date of shipment. If a product proves defective within the respective period, Tektronix will provide repair or replacement as described in the complete warranty statement.

To arrange for service or obtain a copy of the complete warranty statement, please contact your nearest Tektronix sales and service office.

EXCEPT AS PROVIDED IN THIS SUMMARY OR THE APPLICABLE WARRANTY STATEMENT, TEKTRONIX MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. General Safety Summary

Review the following safety precautions to avoid injury and prevent damage to this product or any products connected to it. To avoid potential hazards, use this product only as specified.

Only qualified personnel should perform service procedures.

To Avoid Fire or Personal Injury

Use Proper Power Cord. Use only the power cord specified for this product and certified for the country of use.

Connect and Disconnect Properly. Do not connect or disconnect probes or test leads while they are connected to a voltage source.

Ground the Product. This product is grounded through the grounding conductor of the power cord. To avoid electric shock, the grounding conductor must be connected to earth ground. Before making connections to the input or output terminals of the product, ensure that the product is properly grounded.

Connect the Probe Properly. The probe ground lead is at ground potential. Do not connect the ground lead to an elevated voltage.

Observe All Terminal Ratings. To avoid fire or shock hazard, observe all ratings and marking on the product. Consult the product manual for further ratings information before making connections to the product.

Do Not Operate Without Covers. Do not operate this product with covers or panels removed.

Use Proper Fuse. Use only the fuse type and rating specified for this product.

Avoid Exposed Circuitry. Do not touch exposed connections and components when power is present.

Do Not Operate With Suspected Failures. If you suspect there is damage to this product, have it inspected by qualified service personnel.

Provide Proper Ventilation. Refer to the manual’s installation instructions for details on installing the product so it has proper ventilation.
Do Not Operate in Wet/Damp Conditions.
Do Not Operate in an Explosive Atmosphere.
Keep Product Surfaces Clean and Dry.

Safety Terms and Symbols

**Terms in This Manual.** These terms may appear in this manual:

- **WARNING.** Warning statements identify conditions or practices that could result in injury or loss of life.

- **CAUTION.** Caution statements identify conditions or practices that could result in damage to this product or other property.

**Terms on the Product.** These terms may appear on the product:

- DANGER indicates an injury hazard immediately accessible as you read the marking.
- WARNING indicates an injury hazard not immediately accessible as you read the marking.
- CAUTION indicates a hazard to property including the product.

**Symbols on the Product.** These symbols may appear on the product:

- Protective Ground (Earth) Terminal
- Measurement Ground Terminal
- CAUTION Refer to Manual
- Measurement Input Terminal
- Mains Disconnected OFF (Power)
- Mains Connected ON (Power)
Preface

This manual contains operating information for the TDS1000-Series and TDS2000-Series Digital Storage Oscilloscopes. The manual consists of the following chapters:

- The *Getting Started* chapter briefly describes features of the oscilloscope and provides installation instructions.

- The *Understanding Oscilloscope Functions* chapter describes basic operations and functions of the oscilloscope: setting up the oscilloscope, triggering, acquiring data, scaling and positioning waveforms, and taking measurements.

- The *Operating Basics* chapter covers operating principles of the oscilloscope.

- The *Application Examples* chapter includes examples of a wide variety of measurements to give you ideas on how to solve your own measurement problems.

- The *Reference* chapter describes the selections or available range of values for each option.
- The Math FFT chapter contains detailed information about how to use the Math FFT function.

- The TDS2CMA Communications Module chapter describes this optional module and how to set up the RS-232, GPIB, and Centronics ports to use the oscilloscope with external devices, such as printers and computers.

- The Appendix A: Specifications chapter includes electrical, environmental, and physical specifications for the oscilloscope, as well as certifications and compliances.

- The Appendix B: Accessories chapter briefly describes standard and optional accessories.

- The Appendix C: General Care and Cleaning chapter describes how to take care of the oscilloscope.

- The Appendix D: Default Setup chapter contains a list of the menus and controls with the default (factory) settings that are recalled when you push the DEFAULT SETUP front-panel button.

- The Appendix E: GPIB and RS-232 Interfaces chapter compares the two protocols to help you decide which one to use.
Help System

The oscilloscope has a Help system with topics that cover all the features of the oscilloscope. You can use the Help system to display several kinds of information:

- General information about understanding and using the oscilloscope, such as Using the Menu System.
- Information about specific menus and controls, such as the Vertical Position Control.
- Advice about problems you may face while using an oscilloscope, such as Reducing Noise.

The Help system provides three ways for you to find the information you need: context-sensitive, hyperlinks, and an index.

**Context-Sensitive**

The oscilloscope displays information about the last menu displayed on the screen when you push the HELP front-panel button. The HELP SCROLL LED lights under the HORIZONTAL POSITION knob to indicate the alternative function of the knob. If the topic uses more than one page, turn the HELP SCROLL knob to move from page to page within the topic.
Hyperlinks

Most of the help topics contain phrases marked with angle brackets, such as <Autoset>. These are links to other topics. Turn the HELP SCROLL knob to move the highlight from one link to another. Push the Show Topic option button to display the topic corresponding to the highlighted link. Push the Back option button to return to the previous topic.

Index

Push the front-panel HELP button, then push the Index option button. Push the Page Up or Page Down option buttons until you find the index page that contains the topic you want to view. Turn the HELP SCROLL knob to highlight a help topic. Push the Show Topic option button to display the topic.

NOTE. Push the Exit option button or any menu button to remove the Help text from the screen and return to displaying waveforms.
Conventions

This manual uses the following conventions:

- Front-panel buttons, knobs and connectors appear in all uppercase letters. For example: HELP, PRINT.

- Menu options appear with the first letter of each word in uppercase. For example: Peak Detect, Window Zone.

**NOTE.** Option buttons can also be called screen buttons, side-menu buttons, bezel buttons, or soft keys.

- The ► delimiter separates a series of button pushes. For example, UTILITY ► Options ► RS-232 means that you push the UTILITY button, then push the Options option button, and then push the RS-232 option button.
Product End-of-Life Handling

Components that Contain Mercury. The cold cathode fluorescent tube located in the liquid crystal display backlight contains trace amounts of mercury. When you are ready to reclaim the instrument, you must properly transfer it according to local regulations concerning mercury-containing equipment or ship the instrument to the Tektronix Recycling Operations (RAMS). You can contact Tektronix for the RAMS shipping address and instructions.
Contacting Tektronix

Phone: 1-800-833-9200*

Address: Tektronix, Inc.
Department or name (if known)
14200 SW Karl Braun Drive
P.O. Box 500
Beaverton, OR 97077
USA

Web site: www.tektronix.com

Sales support: 1-800-833-9200, select option 1*

Service support: 1-800-833-9200, select option 2*

Technical support: Email: techsupport@tektronix.com
1-800-833-9200, select option 3*
6:00 a.m. - 5:00 p.m. Pacific time

* This phone number is toll free in North America. After office hours, please leave a voice mail message. Outside North America, contact a Tektronix sales office or distributor; see the Tektronix web site for a list of offices.
Getting Started

TDS1000-Series and TDS2000-Series Digital Storage Oscilloscopes are small, lightweight, benchtop packages that you can use to take ground-referenced measurements.

In addition to the list of general features, this chapter describes how to do the following tasks:

- Install your product
- Perform a brief functional check
- Perform a probe check and compensate probes
- Match your probe attenuation factor
- Use the self calibration routine

**NOTE.** You can select a language to display on the screen when you power on the oscilloscope. At any time, you can push the UTILITY button, and push the Language option button to select a language.
General Features

The next table and bulleted list describe the general features.

- Context-sensitive Help system
- Color or monochrome LCD display
- Selectable 20 MHz bandwidth limit
- 2500 point record length for each channel
- Autoset Menu
- Probe Check Wizard
- Cursors with readouts
- Trigger frequency readout
- Eleven automatic measurements
- Waveform averaging and peak detection
Getting Started

- Dual time base
- Math Fast Fourier Transform (FFT)
- Pulse Width trigger capability
- Video trigger capability with line-selectable triggering
- External trigger
- Setup and waveform storage
- Variable persistence display
- RS-232, GPIB, and Centronics ports with the optional TDS2CMA Communications Extension Module
- User interface in ten user-selectable languages
Installation

**Power Cord**

Use only power cords designed for your oscilloscope. Use a power source that delivers 90 to 264 VAC\textsubscript{RMS}, 45 to 66 Hz. If you have a 400 Hz power source, it must deliver 90 to 132 VAC\textsubscript{RMS}, 360 to 440 Hz. Refer to page 171 for a list of available power cords.

**Security Loop**

Use the built-in cable channels to secure both your oscilloscope and extension module to your location.
Functional Check

Perform this quick functional check to verify that your oscilloscope is operating correctly.

1. Power on the oscilloscope.

Wait until the display shows that all power-on tests passed. Push the DEFAULT SETUP button. The default Probe option attenuation setting is 10X.

2. Set the switch to 10X on the P2200 probe and connect the probe to channel 1 on the oscilloscope. To do this, align the slot in the probe connector with the key on the CH 1 BNC, push to connect, and twist to the right to lock the probe in place.

Connect the probe tip and reference lead to the PROBE COMP connectors.

3. Push the AUTOSET button. Within a few seconds, you should see a square wave in the display of about 5 V peak-to-peak at 1 kHz.

Push the CH 1 MENU button twice to remove channel 1, push the CH 2 MENU button to display channel 2, repeat steps 2 and 3. For 4-channel models, repeat for CH 3 and CH 4.
**Probe Safety**

A guard around the probe body provides a finger barrier for protection from electric shock.

![Finger guard](image)

**WARNING.** To avoid electric shock when using the probe, keep fingers behind the guard on the probe body.

*To avoid electric shock while using the probe, do not touch metallic portions of the probe head while it is connected to a voltage source.*

Connect the probe to the oscilloscope and connect the ground terminal to ground before you take any measurements.
Probe Check Wizard

You can use the Probe Check Wizard to quickly verify that your probe is operating properly. The wizard also helps you adjust the probe compensation (usually adjusted with a screw on the probe body or probe connector) and set the Probe option attenuation factor in the vertical menu (for example, the menu that appears when you push the CH 1 MENU button).

You should do this each time you connect a probe to an input channel.

To use the Probe Check Wizard, push the PROBE CHECK button. If your probe is connected properly, compensated properly, and the Probe entry in the oscilloscope VERTICAL menu is set to match your probe, the oscilloscope will display a PASSED message at the bottom of the screen. Otherwise, the oscilloscope will display directions on the screen to guide you in correcting these problems.

NOTE. Probe check is useful for 1X, 10X, and 100X probes; it does not work with the EXT TRIG front-panel BNC.

To compensate a probe connected to the EXT TRIG front-panel BNC, follow these steps:

1. Connect the probe to any channel BNC, such as to CH 1.

2. Push the PROBE CHECK button and follow the directions on the screen.

3. After you verify that the probe functions properly and is compensated, connect the probe to the EXT TRIG BNC.
**Manual Probe Compensation**

As an alternative method to Probe Check, you can manually perform this adjustment to match your probe to the input channel.

1. Set the Probe option attenuation in the channel menu to 10X. Set the switch to 10X on the P2200 probe and connect the probe to channel 1 on the oscilloscope. If you use the probe hook-tip, ensure a proper connection by firmly inserting the tip onto the probe.

2. Attach the probe tip to the PROBE COMP ~5V connector and the reference lead to the PROBE COMP Ground connector. Display the channel and then push the AUTOSET button.

3. Check the shape of the displayed waveform.

4. If necessary, adjust your probe.

   Repeat as necessary.
Probe Attenuation Setting

Probes are available with various attenuation factors which affect the vertical scale of the signal. The Probe Check function verifies that the Probe attenuation option matches the attenuation of the probe.

As an alternative method to Probe Check, you can push a vertical menu button (such as the CH 1 MENU button), and select the Probe option that matches the attenuation factor of your probe.

**NOTE.** *The default setting for the Probe option is 10X.*

Be sure that the Attenuation switch on the P2200 probe matches the Probe option in the oscilloscope. Switch settings are 1X and 10X.

**NOTE.** *When the Attenuation switch is set to 1X, the P2200 probe limits the bandwidth of the oscilloscope to 7 MHz. To use the full bandwidth of the oscilloscope, be sure to set the switch to 10X.*
Self Calibration

The self calibration routine lets you optimize the oscilloscope signal path for maximum measurement accuracy. You can run the routine at any time but should always run the routine if the ambient temperature changes by 5°C or more.

To compensate the signal path, disconnect any probes or cables from the front-panel input connectors. Then, push the UTILITY button, select the Do Self Cal option and follow the directions on the screen.
Understanding Oscilloscope Functions

This chapter contains information on what you need to understand before you use an oscilloscope. To use your oscilloscope effectively, you need to learn about the following oscilloscope functions:

- Setting up the oscilloscope
- Triggering
- Acquiring signals (waveforms)
- Scaling and positioning waveforms
- Measuring waveforms

The figure below shows a block diagram of the various functions of the oscilloscope and their relationship to each other.
Setting Up the Oscilloscope

You should become familiar with three functions that you may use often when operating your oscilloscope: Autoset, saving a setup, and recalling a setup.

Using Autoset
The Autoset function obtains a stable waveform display for you. It automatically adjusts the vertical scale, horizontal scale and trigger settings. Autoset also displays several automatic measurements in the graticule area, depending on the signal type.

Saving a Setup
The oscilloscope saves the current setup if you wait five seconds after the last change before you power off the oscilloscope. The oscilloscope recalls this setup the next time you apply power.

You can use the SAVE/RECALL Menu to permanently save up to ten different setups.

Recalling a Setup
The oscilloscope can recall the last setup before power off, any of your saved setups or the default setup. See page 175.
**Default Setup**

The oscilloscope is set up for normal operation when it is shipped from the factory. This is the default setup. To recall this setup, push the DEFAULT SETUP button. To view the default settings, refer to *Appendix D: Default Setup*.

**Triggering**

The trigger determines when the oscilloscope starts to acquire data and display a waveform. When a trigger is set up properly, the oscilloscope converts unstable displays or blank screens into meaningful waveforms.

For oscilloscope-specific descriptions, refer to page 36 in the *Operating Basics* chapter and page 99 in the *Reference* chapter.
When you push the RUN/STOP or SINGLE SEQ buttons to start an acquisition, the oscilloscope goes through the following steps:

1. Acquires enough data to fill the portion of the waveform record to the left of the trigger point. This is also called the pretrigger.
2. Continues to acquire data while waiting for the trigger condition to occur.
3. Detects the trigger condition.
4. Continues to acquire data until the waveform record is full.
5. Displays the newly-acquired waveform.

**NOTE.** For Edge and Pulse triggers, the oscilloscope counts the rate at which trigger events occur to determine trigger frequency and displays the frequency in the lower right corner of the screen.

**Source**

You can use the Trigger Source options to select the signal that the oscilloscope uses as a trigger. The source can be any signal connected to a channel BNC, to the EXT TRIG BNC or the AC power line (available only with Edge triggers).
Types
The oscilloscope provides three types of triggers: Edge, Video, and Pulse Width.

Modes
You can select a Trigger Mode to define how the oscilloscope acquires data when it does not detect a trigger condition. The modes are Auto and Normal.

To perform a single sequence acquisition, push the SINGLE SEQ button.

Coupling
You can use the Trigger Coupling option to determine which part of the signal will pass to the trigger circuit. This can help you attain a stable display of the waveform.

To use trigger coupling, push the TRIG MENU button, select an Edge or Pulse trigger, and select a Coupling option.

NOTE. Trigger coupling affects only the signal passed to the trigger system. It does not affect the bandwidth or coupling of the signal displayed on the screen.

To view the conditioned signal being passed to the trigger circuit, push and hold down the TRIG VIEW button.
Position
The horizontal position control establishes the time between the trigger and the screen center. Refer to *Horizontal Scale and Position; Pretrigger Information* on page 19 for more information on how to use this control to position the trigger.

Slope and Level
The Slope and Level controls help to define the trigger. The Slope option (Edge trigger type only) determines whether the oscilloscope finds the trigger point on the rising or the falling edge of a signal. The TRIGGER LEVEL knob controls where on the edge the trigger point occurs.
Acquiring Signals

When you acquire a signal, the oscilloscope converts it into a digital form and displays a waveform. The acquisition mode defines how the signal is digitized and the time base setting affects the time span and level of detail in the acquisition.

**Acquisition Modes**

There are three acquisition modes: Sample, Peak Detect, and Average.

**Sample.** In this acquisition mode, the oscilloscope samples the signal in evenly spaced intervals to construct the waveform. This mode accurately represents signals most of the time. However, this mode does not acquire rapid variations in the signal that may occur between samples. This can result in aliasing (described on page 20) and may cause narrow pulses to be missed. In these cases, you should use the Peak Detect mode to acquire data.

**Peak Detect.** In this acquisition mode, the oscilloscope finds the highest and lowest values of the input signal over each sample interval and uses these values to display the waveform. In this way, the oscilloscope can acquire and display narrow pulses, which may have otherwise been missed in Sample mode. Noise will appear to be higher in this mode.

**Average.** In this acquisition mode, the oscilloscope acquires several waveforms, averages them, and displays the resulting waveform. You can use this mode to reduce random noise.
Understanding Oscilloscope Functions

**Time Base**

The oscilloscope digitizes waveforms by acquiring the value of an input signal at discrete points. The time base allows you to control how often the values are digitized.

To adjust the time base to a horizontal scale that suits your purpose, use the SEC/DIV knob.

**Scaling and Positioning Waveforms**

You can change the display of waveforms by adjusting their scale and position. When you change the scale, the waveform display will increase or decrease in size. When you change the position, the waveform will move up, down, right, or left.

The channel reference indicator (located on the left of the graticule) identifies each waveform on the display. The indicator points to the ground level of the waveform record.

To view the display area and readouts, refer to page 28.

**Vertical Scale and Position**

You can change the vertical position of waveforms by moving them up or down in the display. To compare data, you can align a waveform above another or you can align waveforms on top of each other.

You can change the vertical scale of a waveform. The waveform display will contract or expand about the ground level.

For oscilloscope-specific descriptions, refer to page 34 in the *Operating Basics* chapter and page 112 in the *Reference* chapter.
Horizontal Scale and Position; Pretrigger Information

You can adjust the HORIZONTAL POSITION control to view waveform data before the trigger, after the trigger, or some of each. When you change the horizontal position of a waveform, you are actually changing the time between the trigger and the center of the display. (This appears to move the waveform to the right or left on the display.)

For example, if you want to find the cause of a glitch in your test circuit, you might trigger on the glitch and make the pretrigger period large enough to capture data before the glitch. You can then analyze the pretrigger data and perhaps find the cause of the glitch.

You change the horizontal scale of all the waveforms by turning the SEC/DIV knob. For example, you might want to see just one cycle of a waveform to measure the overshoot on its rising edge.

The oscilloscope shows the horizontal scale as time per division in the scale readout. Since all active waveforms use the same time base, the oscilloscope only displays one value for all the active channels, except when you use Window Zone. For information on how to use the window function, refer to page 92.

For oscilloscope-specific descriptions, refer to page 35 in the Operating Basics chapter and page 90 in the Reference chapter.
**Time Domain Aliasing.** Aliasing occurs when the oscilloscope does not sample the signal fast enough to construct an accurate waveform record. When this happens, the oscilloscope displays a waveform with a frequency lower than the actual input waveform, or triggers and displays an unstable waveform.

The oscilloscope accurately represents signals, but is limited by the probe bandwidth, the oscilloscope bandwidth, and the sample rate. To avoid aliasing, the oscilloscope must sample the signal more than twice as fast as the highest frequency component of the signal.

The highest frequency that the oscilloscope sampling rate can theoretically represent is the Nyquist frequency. The sample rate is called the Nyquist rate, and is twice the Nyquist frequency.
Oscilloscope models with 60 MHz or 100 MHz bandwidth sample at rates up to 1 GS/s. Models with 200 MHz bandwidth sample at rates up to 2 GS/s. In both cases, these maximum sample rates are at least ten times the bandwidth. These high sample rates help reduce the possibility of aliasing.

There are several ways to check for aliasing:

- Turn the SEC/DIV knob to change the horizontal scale. If the shape of the waveform changes drastically, you may have aliasing.

- Select the Peak Detect acquisition mode (described on page 17). This mode samples the highest and lowest values so that the oscilloscope can detect faster signals. If the shape of the waveform changes drastically, you may have aliasing.

- If the trigger frequency is faster than the display information, you may have aliasing or a waveform that crosses the trigger level multiple times. Examining the waveform should allow identifying whether the shape of the signal is going to allow a single trigger crossing per cycle at the selected trigger level. If multiple triggers are likely to occur, select a trigger level that will generate only a single trigger per cycle. If the trigger frequency is still faster than the display indicates, you may have aliasing.

  If the trigger frequency is slower, this test is not useful.

- If the signal you are viewing is also the trigger source, use the graticule or the cursors to estimate the frequency of the displayed waveform. Compare this to the Trigger Frequency readout in the lower right corner of the screen. If they differ by a large amount, you may have aliasing.
The next table lists the time bases that you should use to avoid aliasing at various frequencies and the respective sample rate. At the fastest SEC/DIV setting, aliasing is not likely to occur due to the bandwidth limitations of the oscilloscope input amplifiers.

<table>
<thead>
<tr>

Taking Measurements

The oscilloscope displays graphs of voltage versus time and can help you to measure the displayed waveform.

There are several ways to take measurements. You can use the graticule, the cursors, or an automated measurement.

Graticule

This method allows you to make a quick, visual estimate. For example, you might look at a waveform amplitude and determine that it is a little more than 100 mV.

You can take simple measurements by counting the major and minor graticule divisions involved and multiplying by the scale factor.

For example, if you counted five major vertical graticule divisions between the minimum and maximum values of a waveform and knew you had a scale factor of 100 mV/division, then you could easily calculate your peak-to-peak voltage as follows:

\[
5 \text{ divisions} \times 100 \text{ mV/division} = 500 \text{ mV}.
\]
Cursors

This method allows you to take measurements by moving the cursors, which always appear in pairs, and reading their numeric values from the display readouts. There are two types of cursors: Voltage and Time.

When you use cursors, be sure to set the Source to the waveform on the display that you want to measure.

To use cursors, push the CURSOR button.

Voltage Cursors. Voltage cursors appear as horizontal lines on the display and measure the vertical parameters.

Time Cursors. Time cursors appear as vertical lines on the display and measure the horizontal parameters.

Automatic

The MEASURE Menu can take up to five automatic measurements. When you take automatic measurements, the oscilloscope does all the calculating for you. Because the measurements use the waveform record points, they are more accurate than the graticule or cursor measurements.

Automatic measurements use readouts to show measurement results. These readouts are updated periodically as the oscilloscope acquires new data.

For measurement descriptions, refer to page 94 in the Reference chapter.
Operating Basics

The front panel is divided into easy-to-use functional areas. This chapter provides you with a quick overview of the controls and the information displayed on the screen. The next figure shows the front panels for 2-channel and 4-channel models.
Display Area

In addition to displaying waveforms, the display is filled with many details about the waveform and the oscilloscope control settings.

**NOTE.** For similar details for the FFT function, refer to page 119.

1. Icon display shows acquisition mode.
   - ![Sample mode](image)
   - ![Peak detect mode](image)
   - ![Average mode](image)

   M Pos: -11.30ms
   CH1 500mV
   CH2 200mV
   Default setup recalled
   1.000kHz
   12 4 3
   16
2. Trigger status indicates the following:

- **Armed.** The oscilloscope is acquiring pretrigger data. All triggers are ignored in this state.
- **Ready.** All pretrigger data has been acquired and the oscilloscope is ready to accept a trigger.
- **Triggered.** The oscilloscope has seen a trigger and is acquiring the posttrigger data.
- **Stop.** The oscilloscope has stopped acquiring waveform data.
- **Acq. Complete.** The oscilloscope has completed a Single Sequence acquisition.
- **Auto.** The oscilloscope is in auto mode and is acquiring waveforms in the absence of triggers.

3. Marker shows horizontal trigger position. Turn the HORIZONTAL POSITION knob to adjust the position of the marker.

4. Readout shows the time at the center graticule. The trigger time is zero.

5. Marker shows Edge or Pulse Width trigger level.

6. On-screen markers show the ground reference points of the displayed waveforms. If there is no marker, the channel is not displayed.
7. An arrow icon indicates that the waveform is inverted.

8. Readouts show the vertical scale factors of the channels.

9. A \( B_W \) icon indicates that the channel is bandwidth limited.

10. Readout shows main time base setting.

11. Readout shows window time base setting if it is in use.

12. Readout shows trigger source used for triggering.

13. Icon shows selected trigger type as follows:

\[ \begin{align*}
\uparrow & - \text{ Edge trigger for the rising edge.} \\
\downarrow & - \text{ Edge trigger for the falling edge.} \\
\swarrow & - \text{ Video trigger for line sync.} \\
\searrow & - \text{ Video trigger for field sync.} \\
\updownarrow & - \text{ Pulse Width trigger, positive polarity.} \\
\updownarrow_{\text{neg}} & - \text{ Pulse Width trigger, negative polarity.}
\end{align*} \]

14. Readout shows Edge or Pulse Width trigger level.

15. Display area shows helpful messages; some messages display for only three seconds.

If you recall a saved waveform, readout shows information about the reference waveform, such as \text{RefA 1.00V 500\mu s}.

16. Readout shows trigger frequency.
Message Area

The oscilloscope displays a message area (item number 15 in the previous figure) at the bottom of the screen that conveys the following types of helpful information:

- Directions to access another menu, such as when you push the TRIG MENU button:
  
  For TRIGGER HOLDOFF, go to HORIZONTAL Menu

- Suggestion of what you might want to do next, such as when you push the MEASURE button:
  
  Push an option button to change its measurement

- Information about the action the oscilloscope performed, such as when you push the DEFAULT SETUP button:
  
  Default setup recalled

- Information about the waveform, such as when you push the AUTOSET button:
  
  Square wave or pulse detected on CH1
Using the Menu System

The user interface of TDS1000- and TDS2000-series oscilloscopes was designed for easy access to specialized functions through the menu structure.

When you push a front-panel button, the oscilloscope displays the corresponding menu on the right side of the screen. The menu shows the options that are available when you push the unlabeled option buttons directly to the right of the screen. (Some documentation may also refer to the option buttons as screen buttons, side-menu buttons, bezel buttons, or soft keys.)

The oscilloscope uses four methods to display menu options:

- Page (Submenu) Selection: For some menus, you can use the top option button to choose two or three submenus. Each time you push the top button, the options change. For example, when you push the top button in the SAVE/REC Menu, the oscilloscope cycles through the Setups and Waveforms submenus.

- Circular List: The oscilloscope sets the parameter to a different value each time you push the option button. For example, you can push the CH 1 MENU button and then push the top option button to cycle through the Vertical (channel) Coupling options.
- **Action**: The oscilloscope displays the type of action that will immediately occur when you push an Action option button. For example, when you push the DISPLAY Menu button and then push the Contrast Increase option button, the oscilloscope changes the contrast immediately.

- **Radio**: The oscilloscope uses a different button for each option. The currently-selected option is highlighted. For example, the oscilloscope displays various acquisition mode options when you push the ACQUIRE Menu button. To select an option, push the corresponding button.
Vertical Controls

**CH 1, CH 2, CH 3, CH 4, CURSOR 1 and CURSOR 2 POSITION.** Positions the waveform vertically. When you display and use cursors, an LED lights to indicate the alternative function of the knobs to move the cursors.

**CH 1, CH 2, CH 3 & CH 4 MENU.** Displays the vertical menu selections and toggles the display of the channel waveform on and off.

**VOLTS/DIV (CH 1, CH 2, CH 3 & CH 4).** Selects calibrated scale factors.

**MATH MENU.** Displays waveform math operations menu and can also be used to toggle the math waveform on and off.
Horizontal Controls

POSITION. Adjusts the horizontal position of all channel and math waveforms. The resolution of this control varies with the time base setting. For information on windows, refer to page 92.

NOTE. To make a large adjustment to the horizontal position, turn the SEC/DIV knob to a larger value, change the horizontal position, and then turn the SEC/DIV knob back to the previous value.

When you view help topics, you can use this knob to scroll through links or index entries.
**HORIZ MENU.** Displays the Horizontal Menu.

**SET TO ZERO.** Sets the horizontal position to zero.

**SEC/DIV.** Selects the horizontal time/div (scale factor) for the main or the window time base. When Window Zone is enabled, it changes the width of the window zone by changing the window time base. Refer to page 92 for details about creating and using Window Zone.

### Trigger Controls

#### 4-channel models

- **LEVEL**
- **SET TO 50%**
- **FORCE TRIG**
- **TRIG VIEW**
- **USER SELECT**
- **TRIG MENU**

#### 2-channel models

**LEVEL and USER SELECT.** When you use an Edge trigger, the primary function of the LEVEL knob is to set the amplitude level the signal must cross to cause an acquisition. You can also use the knob to perform USER SELECT alternative functions. The LED lights below the knob to indicate an alternative function.
### USER SELECT

<table>
<thead>
<tr>
<th>USER SELECT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Holdoff</td>
<td>Sets the amount of time before another trigger event can be accepted; refer to <em>Holdoff</em> on page 109</td>
</tr>
<tr>
<td>Video line number</td>
<td>Sets the oscilloscope to a specific line number when the Trigger Type option is set to Video and the Sync option is set to Line Number</td>
</tr>
<tr>
<td>Pulse width</td>
<td>Sets the width of the pulse when the Trigger Type option is set to Pulse and you select the Set Pulse Width option</td>
</tr>
</tbody>
</table>

**TRIG MENU.** Displays the Trigger Menu.

**SET TO 50%**. The trigger level is set to the vertical midpoint between the peaks of the trigger signal.

**FORCE TRIG.** Completes an acquisition regardless of an adequate trigger signal. This button has no effect if the acquisition is already stopped.

**TRIG VIEW.** Displays the trigger waveform in place of the channel waveform while the TRIG VIEW button is held down. You can use this to see how the trigger settings affect the trigger signal, such as trigger coupling.
Menu and Control Buttons

All models

**SAVE/RECALL.** Displays the Save/Recall Menu for setups and waveforms.

**MEASURE.** Displays the automated measurements menu.

**ACQUIRE.** Displays the Acquire Menu.

**DISPLAY.** Displays the Display Menu.

**CURSOR.** Displays the Cursor Menu. Vertical Position controls adjust cursor position while displaying the Cursor Menu and the cursors are activated. Cursors remain displayed (unless the Type option is set to Off) after leaving the Cursor Menu but are not adjustable.

**UTILITY.** Displays the Utility Menu.

**HELP.** Displays the Help Menu.

**DEFAULT SETUP.** Recalls the factory setup.

**AUTOSET.** Automatically sets the oscilloscope controls to produce a usable display of the input signals.

**SINGLE SEQ.** Acquires a single waveform and then stops.

**RUN/STOP.** Continuously acquires waveforms or stops the acquisition.

**PRINT.** Starts print operations. An extension module with a Centronics, RS-232, or GPIB port is required. Refer to *Optional Accessories* on page 169.
Connectors

2-channel models

4-channel models

**PROBE COMP.** Voltage probe compensation output and ground. Use to electrically match the probe to the oscilloscope input circuit. Refer to page 8. The probe compensation ground and BNC shields connect to earth ground and are considered to be ground terminals.

---

**CAUTION.** If you connect a voltage source to a ground terminal, you may damage the oscilloscope or the circuit under test. To avoid this, do not connect a voltage source to any ground terminals.

---

**CH 1, CH 2, CH 3 & CH 4.** Input connectors for waveform display.

**EXT TRIG.** Input connector for an external trigger source. Use the Trigger Menu to select the Ext or Ext/5 trigger source.
This section presents a series of application examples. These simplified examples highlight the features of the oscilloscope and give you ideas for using it to solve your own test problems.

- Taking simple measurements
  - Using Autoset
  - Using the Measure Menu to take automatic measurements
  - Measuring two signals and calculating gain
- Taking cursor measurements
  - Measuring ring frequency and ring amplitude
  - Measuring pulse width
  - Measuring rise time
- Analyzing signal detail
  - Looking at a noisy signal
  - Using the average function to separate a signal from noise
- Capturing a single-shot signal
  - Optimizing the acquisition
- Measuring propagation delay
- Triggering on a pulse width
- Triggering on a video signal
  - Triggering on video fields and video lines
  - Using the window function to see waveform details
- Analyzing a differential communication signal using math functions
- Viewing impedance changes in a network using XY mode and persistence
Taking Simple Measurements

You need to see a signal in a circuit, but you do not know the amplitude or frequency of the signal. You want to quickly display the signal and measure the frequency, period, and peak-to-peak amplitude.

Using Autoset

To quickly display a signal, follow these steps:

1. Push the CH 1 MENU button and set the Probe option attenuation to **10X**.
2. Set the switch to **10X** on the P2200 probe.
3. Connect the channel 1 probe to the signal.

4. Push the **AUTOSET** button.

The oscilloscope sets the vertical, horizontal, and trigger controls automatically. If you want to optimize the display of the waveform, you can manually adjust these controls.

**NOTE.** The oscilloscope displays relevant automatic measurements in the waveform area of the screen based on the signal type detected.

For oscilloscope-specific descriptions, refer to page 79 in the **Reference** chapter.

**Taking Automatic Measurements**

The oscilloscope can take automatic measurements of most displayed signals. To measure signal frequency, period, and peak-to-peak amplitude, rise time, and positive width, follow these steps:

1. Push the **MEASURE** button to see the Measure Menu.
2. Push the top option button; the Measure 1 Menu appears.
3. Push the **Type** option button and select **Freq**.
   
The **Value** readout displays the measurement and updates.

---

**NOTE.** If a question mark (?) displays in the Value readout, turn the VOLTS/DIV knob for the appropriate channel to increase the sensitivity or change the SEC/DIV setting.

---

4. Push the **Back** option button.

5. Push the second option button from the top; the Measure 2 Menu appears.

6. Push the **Type** option button and select **Period**.
   
The **Value** readout displays the measurement and updates.

7. Push the **Back** option button.

8. Push the middle option button; the Measure 3 Menu appears.

9. Push the **Type** option button and select **Pk-Pk**.
   
The **Value** readout displays the measurement and updates.

10. Push the **Back** option button.
11. Push the second option button from the bottom; the Measure 4 Menu appears.

12. Push the **Type** option button and select **Rise Time**.
    
    The **Value** readout displays the measurement and updates.

13. Push the **Back** option button.

14. Push the bottom option button; the Measure 5 Menu appears.

15. Push the **Type** option button and select **Pos Width**.
    
    The **Value** readout displays the measurement and updates.

16. Push the **Back** option button.
**Measuring Two Signals**

You are testing a piece of equipment and need to measure the gain of the audio amplifier. You have an audio generator that can inject a test signal at the amplifier input. Connect two oscilloscope channels to the amplifier input and output as shown. Measure both signal levels and use the measurements to calculate the gain.
To activate and display the signals connected to channel 1 and to channel 2, follow these steps:

1. If the channels are not displayed, push the CH 1 MENU and CH 2 MENU buttons.
2. Push the AUTOSET button.

To select measurements for the two channels, follow these steps:

1. Push the Measure button to see the Measure Menu.
2. Push the top option button; the Measure 1 Menu appears.
3. Push the Source option button and select CH1.
4. Push the Type option button and select Pk-Pk.
5. Push the Back option button.
6. Push the second option button from the top; the Measure 2 Menu appears.
7. Push the Source option button and select CH2.
8. Push the Type option button and select Pk-Pk.
9. Push the Back option button.

Read the displayed peak-to-peak amplitudes for both channels.

10. To calculate the amplifier voltage gain, use these equations:

\[
VoltageGain = \frac{output\ amplitude}{input\ amplitude}.
\]

\[
VoltageGain\ (dB) = 20 \times \log_{10}(VoltageGain)
\]
Taking Cursor Measurements

You can use the cursors to quickly take time and voltage measurements on a waveform.

Measuring Ring Frequency

To measure the ring frequency at the rising edge of a signal, follow these steps:

1. Push the CURSOR button to see the Cursor Menu.
2. Push the Type option button and select Time.
3. Push the Source option button and select CH1.
4. Turn the CURSOR 1 knob to place a cursor on the first peak of the ring.
5. Turn the CURSOR 2 knob to place a cursor on the second peak of the ring.

You can see the delta time and frequency (the measured ring frequency) in the Cursor Menu.

---

![Cursor Measurements Diagram](image-url)
Measuring Ring Amplitude

You measured the ring frequency in the previous example. Now you want to measure the amplitude of the ringing. To measure the amplitude, follow these steps:

1. Push the CURSOR button to see the Cursor Menu.
2. Push the Type option button and select Voltage.
3. Push the Source option button and select CH1.
4. Turn the CURSOR 1 knob to place a cursor on the highest peak of the ring.
5. Turn the CURSOR 2 knob to place a cursor on the lowest point of the ring.

You can see the following measurements in the Cursor Menu:

- The delta voltage (peak-to-peak voltage of the ringing)
- The voltage at Cursor 1
- The voltage at Cursor 2
Measuring Pulse Width

You are analyzing a pulse waveform, and you want to know the width of the pulse. To measure the width of a pulse using the time cursors, follow these steps:

1. Push the CURSOR button to see the Cursor Menu.
   LEDs light under the VERTICAL POSITION knobs to indicate the alternative CURSOR1 and CURSOR2 functions.

2. Push the Source option button and select CH1.

3. Push the Type option button and select Time.

4. Turn the CURSOR 1 knob to place a cursor on the rising edge of the pulse.

5. Turn the CURSOR 2 knob to place the remaining cursor on the falling edge of the pulse.

You can see the following measurements in the Cursor Menu:

- The time at Cursor 1, relative to the trigger.
- The time at Cursor 2, relative to the trigger.
- The delta time, which is the pulse width measurement.
NOTE. The Positive Width measurement is available as an automatic measurement in the Measure Menu, described on page 94.

The Positive Width measurement also displays when you select the Single-Cycle Square option in the AUTOSET Menu. Refer to page 82.

Measuring Rise Time

After measuring the pulse width, you decide that you need to check the rise time of the pulse. Typically, you measure rise time between the 10% and 90% levels of the waveform. To measure the rise time, follow these steps:

1. Turn the SEC/DIV knob to display the rising edge of the waveform.
2. Turn the **VOLTS/DIV** and **VERTICAL POSITION** knobs to set the waveform amplitude to about five divisions.

3. Push the **CH 1 MENU** button to see the CH1 Menu if it is not displayed.

4. Push the **Volts/Div** option button and select **Fine**.

5. Turn the **VOLTS/DIV** knob to set the waveform amplitude to exactly five divisions.

6. Turn the **VERTICAL POSITION** knob to center the waveform; position the baseline of the waveform 2.5 divisions below the center graticule.

7. Push the **CURSOR** button to see the Cursor Menu.

8. Push the **Type** option button and select **Time**.

9. Turn the **CURSOR 1** knob to place the cursor at the point where the waveform crosses the second graticule line below center screen. This is the 10% level of the waveform.
10. Turn the CURSOR 2 knob to place the second cursor at the point where the waveform crosses the second graticule line above center screen. This is the 90% level of the waveform.

11. The Delta readout in the Cursor Menu is the rise time of the waveform.

NOTE. The Rise Time measurement is available as an automatic measurement in the Measure Menu, described on page 94.

The Rise Time measurement also displays when you select the Rising Edge option in the AUTOSET Menu. Refer to page 82.
Analyzing Signal Detail

You have a noisy signal displayed on the oscilloscope and you need to know more about it. You suspect that the signal contains much more detail than you can now see in the display.

Looking at a Noisy Signal

The signal appears noisy and you suspect that noise is causing problems in your circuit. To better analyze the noise, follow these steps:

1. Push the ACQUIRE button to see the Acquire Menu.

2. Push the Peak Detect option button.

3. If necessary, push the DISPLAY button to see the Display Menu. Use the Contrast Increase and Contrast Decrease option buttons to adjust the contrast to see the noise more easily.

Peak detect emphasizes noise spikes and glitches in your signal, especially when the time base is set to a slow setting.
Separating the Signal from Noise

Now you want to analyze the signal shape and ignore the noise. To reduce random noise in the oscilloscope display, follow these steps:

1. Push the **ACQUIRE** button to see the Acquire Menu.

2. Push the **Average** option button.

3. Push the **Averages** option button to see the effects of varying the number of running averages on the waveform display.

Averaging reduces random noise and makes it easier to see detail in a signal. In the example below, a ring shows on the rising and falling edges of the signal when the noise is removed.
Capturing a Single-Shot Signal

The reliability of a reed relay in a piece of equipment has been poor and you need to investigate the problem. You suspect that the relay contacts arc when the relay opens. The fastest you can open and close the relay is about once per minute so you need to capture the voltage across the relay as a single-shot acquisition.

To set up for a single-shot acquisition, follow these steps:

1. Turn the vertical VOLTS/DIV and horizontal SEC/DIV knobs to the appropriate ranges for the signal you expect to see.
2. Push the ACQUIRE button to see the Acquire Menu.
3. Push the Peak Detect option button.
4. Push the TRIG MENU button to see the Trigger Menu.
5. Push the Slope option button and select Rising.
6. Turn the LEVEL knob to adjust the trigger level to a voltage midway between the open and closed voltages of the relay.
7. Push the SINGLE SEQ button to start the acquisition.

When the relay opens, the oscilloscope triggers and captures the event.

![Graph of a single-shot signal capture](image-url)
Optimizing the Acquisition

The initial acquisition shows the relay contact beginning to open at the trigger point. This is followed by a large spike that indicates contact bounce and inductance in the circuit. The inductance can cause contact arcing and premature relay failure.

You can use the vertical, horizontal, and trigger controls to optimize the settings before the next single-shot event is captured.

When the next acquisition is captured with the new settings (when you push the SINGLE SEQ button again), you can see more detail about the relay contact opening. You can now see that the contact bounces several times as it opens.
Measuring Propagation Delay

You suspect that the memory timing in a microprocessor circuit is marginal. Set up the oscilloscope to measure the propagation delay between the chip-select signal and the data output of the memory device.
To set up to measure propagation delay, follow these steps:

1. If the channels are not displayed, push the CH 1 MENU and then CH 2 MENU buttons.
2. Push the AUTOSET button to trigger a stable display.
3. Adjust the horizontal and vertical controls to optimize the display.
4. Push the CURSOR button to see the Cursor Menu.
5. Push the Type option button and select Time.
6. Push the Source option button and select CH1.
7. Turn the CURSOR 1 knob to place the cursor on the active edge of the chip-select signal.
8. Turn the CURSOR 2 knob to place the second cursor on the data output transition.
9. Read the propagation delay in the Delta readout in the Cursor Menu.
Triggering on a Specific Pulse Width

You are testing the pulse widths of a signal in a circuit. It is critical that the pulses all be a specific width and you need to verify that they are. Edge triggering shows that your signal is as specified, and the pulse width measurement does not vary from the specification. However, you think there might be a problem.

To set up a test for pulse width aberrations, follow these steps:

1. Display the suspect signal on Ch 1. If Ch1 is not displayed, push the CH1 MENU button.
2. Push the AUTOSET button to trigger a stable display.
3. Push the Single Cycle option button in the AUTOSET Menu to view a single cycle of the signal, and to quickly take a Pulse Width measurement.
4. Push the TRIG MENU button.
5. Push the Type option button to select Pulse.
6. Push the **Source** option button to select **CH1**.

7. Turn the **TRIGGER LEVEL** knob to set the trigger level near the bottom of the signal.

8. Push the **When** option button to select = (equal).

9. Push the **Set Pulse Width** option button, and turn the **USER SELECT** knob to set the pulse width to the value reported by the Pulse Width measurement in step 3.

10. Push **-- more-- page 1 of 2** and set the **Mode** option to **Normal**.

   You should achieve a stable display with the oscilloscope triggering on normal pulses.

11. Push the **When** option button to select \( \neq, <, \text{ or } > \). If there are any aberrant pulses that meet the specified When condition, the oscilloscope triggers.

---

**NOTE.** The trigger frequency readout shows the frequency of events the oscilloscope considers to be triggers, and may be less than the frequency of the input signal in Pulse Width trigger mode.

**Triggering on a Video Signal**

You are testing the video circuit in a piece of medical equipment and need to display the video output signal. The video output is an NTSC standard signal. Use the video trigger to obtain a stable display.

![Diagram of video signal setup](image)

**CH 1**

75 Ω terminator
NOTE. Most video systems use 75 ohm cabling. The oscilloscope inputs do not properly terminate low impedance cabling. To avoid amplitude inaccuracy from improper loading and reflections, place a 75 ohm feedthrough terminator (Tektronix part number 011-0055-02 or equivalent) between the 75 ohm coaxial cable from the signal source and the oscilloscope BNC input.

Triggering on Video Fields

Automatic. To trigger on the video fields, follow these steps:

1. Push the AUTOSET button. When Autoset is complete, the oscilloscope displays the video signal with sync on All Fields.

2. Push the Odd Field or Even Field option buttons from the AUTOSET Menu to sync on odd or even fields only.

Manual. An alternative method requires more steps, but may be necessary depending on the video signal. To use the method, follow these steps:

1. Push the TRIG MENU button to see the Trigger Menu.

2. Push the top option button and select Video.

3. Push the Source option button and select CH1.

4. Push the Sync option button and select All Fields, Odd Field, or Even Field.

5. Push the Standard option button and select NTSC.

6. Turn the horizontal SEC/DIV knob to see a complete field across the screen.

7. Turn the vertical VOLTS/DIV knob to ensure that the entire video signal is visible on the screen.
Triggering on Video Lines

Automatic. You can also look at the video lines in the field. To trigger on the video lines, follow these steps:

1. Push the AUTOSET button.
2. Push the top option button to select Line to sync on all lines. (The AUTOSET Menu includes All Lines and Line Number options.)

Manual. An alternative method requires more steps, but may be necessary depending on the video signal. To use the method, follow these steps:

1. Push the TRIG MENU button to see the Trigger Menu.
2. Push the top option button and select Video.
3. Push the Sync option button and select All Lines, or Line Number and turn the USER SELECT knob to set a specific line number.
4. Push the Standard option button and select NTSC.
5. Turn the SEC/DIV knob to see a complete video line across the screen.
6. Turn the VOLTS/DIV knob to ensure that the entire video signal is visible on the screen.
Application Examples

Incoming video signal

75 Ω terminator

CH 1

Using the Window Function to See Waveform Details

You can use the window function to examine a specific portion of a waveform without changing the main display.

If you want to view the color burst in the previous waveform in more detail without changing the main display, follow these steps:

1. Push the HORIZ MENU button to see the Horizontal Menu and select the Main option.

2. Push the Window Zone option button.

3. Turn the SEC/DIV knob and select 500 ns. This will be the SEC/DIV setting of the expanded view.

4. Turn the HORIZONTAL POSITION knob to position the window around the portion of the waveform that you want to expand.
5. Push the **Window** option button to see the expanded portion of the waveform.

6. Turn the **SEC/DIV** knob to optimize viewing the expanded waveform.

To switch between the Main and Window views, push the **Main** or **Window** option button in the Horizontal Menu.
Analyzing a Differential Communication Signal

You are having intermittent problems with a serial data communication link, and you suspect poor signal quality. Set up the oscilloscope to show you a snapshot of the serial data stream so you can verify the signal levels and transition times.

Because this is a differential signal, you use the math function of the oscilloscope to view a better representation of the waveform.
NOTE. Be sure to first compensate both probes. Differences in probe compensation appear as errors in the differential signal.

To activate the differential signals connected to channel 1 and channel 2, follow these steps:

1. Push the CH 1 MENU button and set the Probe option attenuation to 10X.
2. Push the CH 2 MENU button and set the Probe option attenuation to 10X.
3. Set the switches to 10X on the P2200 probes.
4. Push the AUTOSET button.
5. Push the MATH MENU button to see the Math Menu.
6. Push the Operation option button and select -.
7. Push the CH1-CH2 option button to display a new waveform that is the difference between the displayed waveforms.
8. You can adjust the vertical scale and position of the Math waveform. To do so, follow these steps:
   a. Remove the channel 1 and channel 2 waveforms from the display.
   b. Turn the CH 1 and CH 2 VOLTS/DIV and VERTICAL POSITION knobs to adjust the vertical scale and position.
For a more stable display, push the **SINGLE SEQ** button to control the acquisition of the waveform. Each time you push the **SINGLE SEQ** button, the oscilloscope acquires a snapshot of the digital data stream. You can use the cursors or automatic measurements to analyze the waveform, or you can store the waveform to analyze later.

**NOTE.** Vertical sensitivity should match on waveforms used for math operations. If they do not match, and you use cursors to measure the waveform result, a $U$ displays that represents unknown in the level and delta readouts.

**Viewing Impedance Changes in a Network**

You have designed a circuit that needs to operate over a wide temperature range. You need to evaluate the change in impedance of the circuit as the ambient temperature is changed.

Connect the oscilloscope to monitor the input and output of the circuit and capture the changes that occur as you vary the temperature.
To view the input and output of the circuit in an XY display, follow these steps:

1. Push the **CH 1 MENU** button and set the **Probe** option attenuation to **10X**.

2. Push the **CH 2 MENU** button and set the **Probe** option attenuation to **10X**.

3. Set the switches to **10X** on the P2200 probes.

4. Connect the channel 1 probe to the input of the network, and connect the channel 2 probe to the output.

5. Push the **AUTOSET** button.

6. Turn the **VOLTS/DIV** knobs to display approximately the same amplitude signals on each channel.

7. Push the **DISPLAY** button.

8. Push the **Format** option button and select **XY**.

   The oscilloscope displays a Lissajous pattern representing the input and output characteristics of the circuit.

9. Turn the **VOLTS/DIV** and **VERTICAL POSITION** knobs to optimize the display.

10. Push the **Persist** option button and select **Infinite**.

11. Push the **Contrast Increase** or **Contrast Decrease** option buttons to adjust the contrast of the screen.

   As you adjust the ambient temperature, the display persistence captures the changes in the characteristics of the circuit.
Reference

This chapter describes the menus and operating details associated with each front-panel menu button or control.

<td></td>
</tr>
</tbody>
</table>

Key Points
If you probe a noisy square wave signal that contains intermittent, narrow glitches, the waveform displayed will vary depending on the acquisition mode you choose.
**Sample.** Use Sample acquisition mode to acquire 2500 points and display them at the SEC/DIV setting. Sample mode is the default mode.

<table>
<thead>
<tr>
<th>Sample acquisition intervals (2500)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

- **Sample points**
  Sample mode acquires a single sample point in each interval.

The maximum sample rate is 1 GS/s for oscilloscope models with a bandwidth of 60 MHz or 100 MHz and 2 GS/s for the 200 MHz models. At 100 ns and faster settings, this sample rate does not acquire 2500 points. In this case, a Digital Signal Processor interpolates points between the sampled points to make a full 2500 point waveform record.
**Peak Detect.** Use Peak Detect acquisition mode to detect glitches as narrow as 10 ns and to limit the possibility of aliasing. This mode is effective when at the SEC/DIV setting of 5 μs/div or slower.

<table>
<thead>
<tr>
<th>Peak Detect acquisition intervals (1250)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

- Sample points displayed

Peak Detect mode displays the highest and lowest acquired voltage in each interval.

**NOTE.** If you set the SEC/DIV setting to 2.5 μs/div or faster, the acquisition mode changes to Sample because the sample rate is fast enough that Peak Detect is not necessary. The oscilloscope does not display a message to tell you that the mode was changed to Sample.
When there is enough waveform noise, a typical peak detect display shows large black areas. The TDS1000- and TDS2000-series oscilloscopes display this area with diagonal lines to improve display performance.

**Average.** Use Average acquisition mode to reduce random or uncorrelated noise in the signal you want to display. Data is acquired in sample mode, then a number of waveforms are averaged together. Select the number of acquisitions (4, 16, 64, or 128) to average for the waveform.

**RUN/STOP Button.** Push the RUN/STOP button when you want the oscilloscope to continuously acquire waveforms. Push the button again to stop the acquisition.

**SINGLE SEQ Button.** Push the SINGLE SEQ button when you want the oscilloscope to acquire a single waveform and then stop. Each time you push the SINGLE SEQ button, the oscilloscope begins to acquire another waveform. After the oscilloscope detects a trigger it completes the acquisition and stops.
### Acquisition mode

<table>
<thead>
<tr>
<th>Acquisition mode</th>
<th>SINGLE SEQ button</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample, Peak Detect</td>
<td>Sequence is complete when one acquisition is acquired</td>
</tr>
<tr>
<td>Average</td>
<td>Sequence is complete when the defined number of acquisitions is reached (refer to page 74)</td>
</tr>
</tbody>
</table>

**Scan Mode Display.** You can use the Horizontal Scan acquisition mode (also called Roll mode) to continuously monitor signals that change slowly. The oscilloscope displays waveform updates from the left to the right of the screen and erases old points as it displays new points. A moving, one-division-wide blank section of the screen separates the new waveform points from the old.

The oscilloscope changes to the Scan acquisition mode when you turn the SEC/DIV knob to 100 ms/div or slower, and select the Auto Mode option in the TRIGGER Menu.

To disable Scan mode, push the TRIG MENU button and set the Mode option to Normal.

**Stopping the Acquisition.** While the acquisition is running, the waveform display is live. Stopping the acquisition (when you push the RUN/STOP button) freezes the display. In either mode, the waveform display can be scaled or positioned with the vertical and horizontal controls.
## Autoset

When you push the AUTOSET button, the oscilloscope identifies the type of waveform and adjusts controls to produce a usable display of the input signal.

<table>
<thead>
<tr>

</tbody>
</table>
The Autoset function examines all channels for signals and displays corresponding waveforms.

Autoset determines the trigger source based on the following conditions:

- If multiple channels have signals, channel with the lowest frequency signal
- No signals found, the lowest-numbered channel displayed when Autoset was invoked
- No signals found and no channels displayed, oscilloscope displays and uses channel 1
Sine Wave

When you use the Autoset function and the oscilloscope determines that the signal is similar to a sine wave, the oscilloscope displays the following options:

<table>
<thead>
<tr>
<th>Sine wave options</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multi-cycle sine</td>
<td>Displays several cycles with appropriate vertical and horizontal scaling; the oscilloscope displays Cycle RMS, Frequency, Period, and Peak-to-Peak automatic measurements</td>
</tr>
<tr>
<td>Single-cycle sine</td>
<td>Sets the horizontal scale to display about one cycle of the waveform; the oscilloscope displays Mean, and Peak-to-Peak automatic measurements</td>
</tr>
<tr>
<td>FFT</td>
<td>Converts the input time-domain signal into its frequency components and displays the result as a graph of frequency versus magnitude (spectrum); since this is a mathematical calculation, refer to the Math FFT chapter on page 115 for more information</td>
</tr>
<tr>
<td>Undo Setup</td>
<td>Causes the oscilloscope to recall the previous setup</td>
</tr>
</tbody>
</table>
Square Wave or Pulse

When you use the Autoset function and the oscilloscope determines that the signal is similar to a square wave or pulse, the oscilloscope displays the following options:

<table>
<thead>
<tr>
<th>Square wave or pulse options</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multi-cycle square</td>
<td>Displays several cycles with appropriate vertical and horizontal scaling; the oscilloscope displays Pk-Pk, Mean, Period, and Frequency automatic measurements</td>

<td>Displays cursor 2 location (time is referenced to the trigger position,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>voltage is referenced to ground)</td>
</tr>
</tbody>
</table>

* For a Math FFT source, measures magnitude and frequency.

** Available only on 4-channel oscilloscopes.
**NOTE.** The oscilloscope must display a waveform for the cursors and cursor readouts to appear.

**Key Points**

**Cursor Movement.** Use the CURSOR 1 and CURSOR 2 knobs to move cursors 1 and 2. You can move the cursors only while the Cursor Menu is displayed.

**Voltage cursors**

**Time cursors**

**U in Level and Delta Readouts.** Vertical sensitivity should match on waveforms used for math operations. If they do not match, and you use cursors to measure the waveform result of a math operation, a U displays that represents unknown.

**Default Setup**

Push the DEFAULT SETUP button to recall most of the factory option and control settings, but not all. For more information, refer to Appendix D: Default Setup on page 175.
**Display**

Push the DISPLAY button to choose how waveforms are presented and to change the appearance of the entire display.

<table>

</tr>
</tbody>
</table>
Depending on the type, waveforms will be displayed in three different styles: solid, dimmed, and broken.

1. A solid waveform indicates a channel (live) waveform display. The waveform remains solid when the acquisition is stopped if no controls are changed that make the display accuracy uncertain.

Changing the vertical and horizontal controls is allowed on stopped acquisitions.
2. For the TDS1000-series (monochrome monitor), a dimmed waveform indicates reference waveforms or waveforms with persistence applied.

For the TDS2000-series (color monitor), reference waveforms appear white and waveforms with persistence applied appear in the same color as the Main waveform, but with less intensity.

3. A broken line indicates the waveform display no longer matches the controls. This happens when you stop the acquisition, and change a control setting that the oscilloscope is not able to apply to the displayed waveform. For example, changing the trigger controls on a stopped acquisition causes a broken-line waveform.

Key Points

Persistence. The TDS1000- and TDS-2000 series oscilloscopes use “dfm” at a “reduced intensity” for persistence.

With Persistence set to Infinite, record points accumulate until a control is changed.

XY Format. Use the XY format to analyze phase differences, such as those represented by Lissajous patterns. The format plots the voltage on channel 1 against the voltage on channel 2, where channel 1 is the horizontal axis and channel 2 is the vertical axis. The oscilloscope uses the untriggered Sample acquisition mode and displays data as dots. The sampling rate is fixed at 1 MS/s.
**NOTE.** The oscilloscope can capture a waveform in normal YT mode at any sampling rate. You can view the same waveform in XY mode. To do so, stop the acquisition and change the display format to XY.

The controls operate as follows:

- The channel 1 VOLTS/DIV and VERTICAL POSITION controls set the horizontal scale and position.
- The channel 2 VOLTS/DIV and VERTICAL POSITION controls continue to set vertical scale and position.

The following functions do not work in XY display format:

- Reference or Math waveforms
- Cursors
- Autoset (resets display format to YT)
- Time base controls
- Trigger controls

**Help**

Push the HELP button to display the Help menu. The topics cover all the menu options and controls of the oscilloscope. For more information on the Help system, refer to page ix.
Horizontal

You can use the horizontal controls to change the horizontal scale and position of waveforms. The horizontal position readout shows the time represented by the center of the screen, using the time of the trigger as zero. Changing the horizontal scale causes the waveform to expand or contract around the screen center.

<table>

</tr>
</tbody>
</table>

* For video trigger with sync on a line number, the USER SELECT (alternative function) knob switches between setting a line number and Trigger Level.
NOTE. You can push the horizontal option buttons to switch between an entire waveform display and an enlarged, more detailed part of it.

The axis for vertical scale is the ground level. A readout near the top right of the screen displays the current horizontal position in seconds. An M indicates the Main time base and a W indicates the Window time base. The oscilloscope also indicates horizontal position with an arrow icon at the top of the graticle.

Knobs and Buttons

HORIZONTAL POSITION Knob. Use to control the position of the trigger relative to the center of the screen.

SET TO ZERO Button. Use to set the horizontal position to zero.

SEC/DIV Knob (Horizontal Scale). Use to change the horizontal time scale to magnify or compress the waveform.

Key Points

SEC/DIV. If waveform acquisition is stopped (using the RUN/STOP or SINGLE SEQ button), the SEC/DIV control expands or compresses the waveform.
Scan Mode Display (Roll Mode). When the SEC/DIV control is set to 100 ms/div or slower and the trigger mode is set to Auto, the oscilloscope enters the scan acquisition mode. In this mode, the waveform display updates from left to right. There is no trigger or horizontal position control of waveforms during scan mode.

Window Zone. Use the Window Zone option to define a segment of a waveform to see more detail. The Window time base setting cannot be set slower than the Main time base setting.

Window. Expands the Window Zone to cover the entire screen.

NOTE. When you change between the Main, Window Zone, and Window views, the oscilloscope erases any waveform saved on the screen through persistence.

Holdoff. Use holdoff to help stabilize the display of aperiodic waveforms. Refer to Trigger Controls on page 99 for more information.
Math

Push the MATH MENU button to display the waveform math operations. Push the MATH MENU button again to remove the math waveform display. Refer to page 112 for vertical system descriptions.

</tbody>
</table>

* Available only on a 4-channel oscilloscope.

Key Points

VOLTS/DIV. Use the VOLTS/DIV control to scale the waveforms of the channels. The math add or subtract waveform is the visual sum or difference of the channel waveforms.
Measure

Push the MEASURE button to access automatic measurements. There are eleven types of measurements available. You can display up to five at a time.

Push the top option button to display the Measure 1 Menu. You can choose the channel on which to take a measurement in the Source option. You can choose the type of measurement to take in the Type option. Push the Back option button to return to the MEASURE Menu and display the selected measurements.

Key Points

Taking Measurements. You can display up to five automatic measurements at a time for a single waveform (or divided among the waveforms). The waveform channel must be on (displayed) to make a measurement.

Automated measurements cannot be taken on reference or math waveforms, or while using XY or scan mode. The measurements update about two times per second.

Print

Push the PRINT button to send the screen data to a printer or computer.

The print function requires the optional TDS2CMA Communications Extension Module. The module includes Centronics, RS-232, and GPIB ports.

Refer to the *TDS2CMA Communications Module* chapter on page 127 for complete operating information. Refer to *Optional Accessories* on page 169 for ordering information.

Probe Check

You can use the Probe Check Wizard to quickly verify that your probe is operating properly.

To use the Probe Check Wizard, push the PROBE CHECK button. If your probe is connected properly, compensated properly, and the Probe entry in the oscilloscope VERTICAL menu is set to match your probe, the oscilloscope will display a PASSED message at the bottom of the screen. Otherwise, the oscilloscope will display directions on the screen to guide you in correcting these problems.
Save/Recall

Push the SAVE/RECALL button to save or recall oscilloscope setups or waveforms.

**Setups**

<table>
<thead>
<tr>

<td>Specifies the memory location in which to save the current oscilloscope settings or from which to recall the settings</td>
</tr>
<tr>
<td>Save</td>
<td></td>
<td>Completes the save action</td>
</tr>
<tr>
<td>Recall</td>
<td></td>
<td>Recalls the oscilloscope settings stored in the location chosen in the Setup field</td>
</tr>
</tbody>
</table>

**Key Points**

**Saving and Recalling Setups.** The complete setup is stored in nonvolatile memory. When you recall the setup, the oscilloscope will be in the mode from which the setup was saved.

The oscilloscope saves the current setup if you wait three seconds after the last change before you power off the oscilloscope. The oscilloscope then recalls this setup the next time you apply power.

**Recalling the Default Setup.** You can push the DEFAULT SETUP button to initialize the oscilloscope to a known setup. To view option and control settings that the oscilloscope recalls when you push this button, refer to *Appendix D: Default Setup* on page 175.
Waveforms

          CH3*  
          CH4*  
          Math | Choose the waveform display to store |
| Ref      | A  
          B  
          C*  
          D* | Choose the reference location to store or recall a waveform |
| Save**   | | Stores source waveform to the chosen reference location |
| Ref(x)   | On  
          Off | Displays or removes the reference waveform on the screen |

* Available only on 4-channel oscilloscopes.

** Waveform must be displayed to save it as a reference waveform.

Saving and Recalling Waveforms. The oscilloscope must display any waveform that you want to save. Two-channel oscilloscopes can store two reference waveforms in nonvolatile memory. Four-channel oscilloscopes can store four, but only display two at a time.

The oscilloscope can display both reference waveforms and channel waveform acquisitions. Reference waveforms are not adjustable, but the oscilloscope does display the horizontal and vertical scales at the bottom of the screen.
Trigger Controls

You can define the trigger through the Trigger Menu and front-panel controls.

Trigger Types

Three types of triggering are available: Edge, Video, and Pulse Width. A different set of options display for each type of trigger.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge (default)</td>
<td>Triggers the oscilloscope on the rising or falling edge of the input signal when it crosses the trigger level (threshold)</td>

<td></td>
</tr>
</tbody>
</table>

* Available only on 4-channel oscilloscopes.
Trigger Frequency Readout

The oscilloscope counts the rate at which trigger events occur to determine trigger frequency and displays the frequency in the lower right corner of the screen.

Key Points

Mode Options.

<table>
<thead>
<tr>
<th>Mode option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto (default)</td>
<td>Forces the oscilloscope to trigger when it does not detect a trigger within a certain amount of time based on the SEC/DIV setting; you can use this mode in many situations, such as to monitor the level of a power supply output. Use this mode to let the acquisition free-run in the absence of a valid trigger; this mode allows an untriggered, scanning waveform at 100 ms/div or slower time base settings.</td>
</tr>
<tr>
<td>Normal</td>
<td>Updates displayed waveforms only when the oscilloscope detects a valid trigger condition; the oscilloscope displays older waveforms until the oscilloscope replaces them with new ones. Use this mode when you want to see only valid triggered waveforms; when you use this mode, the oscilloscope does not display a waveform until after the first trigger.</td>
</tr>
</tbody>
</table>

To perform a Single Sequence acquisition, push the SINGLE SEQ button.
Source Options.

<table>
<thead>
<tr>
<th>Source option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numbered channels</td>
<td>Triggers on a channel whether or not the waveform is displayed</td>
</tr>
<tr>
<td>Ext</td>
<td>Does not display the trigger signal; the Ext option uses the signal connected to the EXT TRIG front-panel BNC and allows a trigger level range of +1.6V to -1.6V</td>
</tr>
<tr>
<td>Ext/5</td>
<td>Same as Ext option, but attenuates the signal by a factor of five, and allows a trigger level range of +8V to -8V; this extends the trigger level range</td>
</tr>
<tr>
<td>AC Line</td>
<td>This selection uses a signal derived from the power line as the trigger source; trigger coupling is set to DC and the trigger level to 0 volts</td>
</tr>
</tbody>
</table>

Use when you need to analyze signals related to the frequency of the power line, such as lighting equipment and power supply devices; the oscilloscope automatically generates the trigger, sets the Trigger Coupling to DC, and sets the Trigger Level to zero volts.

The AC Line selection is available only when you select the Edge trigger type.

**NOTE.** To view an Ext, Ext/5, or AC Line trigger signal, push and hold down the TRIG VIEW button.
**Coupling.** Coupling allows you to filter the trigger signal used to trigger an acquisition.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC</td>
<td>Passes all components of the signal</td>
</tr>
<tr>
<td>Noise Reject</td>
<td>Adds hysteresis to the trigger circuitry; this reduces sensitivity which reduces the chance of falsely triggering on noise</td>
</tr>
<tr>
<td>HF Reject</td>
<td>Attenuates the high-frequency components above 80 kHz</td>
</tr>
<tr>
<td>LF Reject</td>
<td>Blocks the DC component and attenuates the low-frequency components below 300 kHz</td>
</tr>
<tr>
<td>AC</td>
<td>Blocks DC components and attenuates signals below 10 Hz</td>
</tr>
</tbody>
</table>

**NOTE.** Trigger coupling affects only the signal passed to the trigger system. It does not affect the bandwidth or coupling of the signal displayed on the screen.

**Pretrigger.** The trigger position is typically set at the horizontal center of the screen. In this case, you are able to view five divisions of pretrigger information. Adjusting the Horizontal Position of the waveform allows you to see more or less pretrigger information.
Video Trigger

</tr>
</tbody>
</table>

* Available only on 4-channel oscilloscopes.
**Trigger Frequency Readout**

The oscilloscope counts the rate at which trigger events occur to determine trigger frequency and displays the frequency in the lower right corner of the screen.

**Key Points**

**Trigger When.** The pulse width of the source must be $\geq 5$ ns for the oscilloscope to detect the pulse.

<table>
<thead>
<tr>
<th>When options</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>Triggers the oscilloscope when the signal pulse width is equal to or not equal to the specified pulse width within a $\pm 5%$ tolerance</td>
</tr>
<tr>
<td>$\neq$</td>
<td></td>
</tr>
<tr>
<td>&lt;</td>
<td>Triggers the oscilloscope when the source signal pulse width is less than or greater than the specified pulse width</td>
</tr>
<tr>
<td>&gt;</td>
<td></td>
</tr>
</tbody>
</table>

- Triggers when pulse is less than width setting

- Triggers when pulse is greater than width setting

- Triggers when pulse is equal to width setting $\pm 5\%$

- Triggers when pulse is not equal to width setting $\pm 5\%$

* = Trigger point

Refer to page 60 for an example of triggering on aberrant pulses.
Knobs and Buttons

**LEVEL or USER SELECT Knob.** Use to control the Trigger Level, Trigger Holdoff, Video Line Number or Pulse Width. The primary function of this knob is to set the trigger level. When an alternative function is active, the USER SELECT LED lights below the knob.

<table>
<thead>
<tr>
<th>USER SELECT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Holdoff</td>
<td>Sets the amount of time before another trigger event can be accepted; to switch between the Trigger Level and Holdoff functions, change the Trig Knob option in the Horizontal Menu</td>
</tr>
<tr>
<td>Video line number</td>
<td>Sets the oscilloscope to a specific line number when the Trigger Type option is set to Video and the Sync option is set to Line Number</td>
</tr>
<tr>
<td>Pulse width</td>
<td>Sets the width of the pulse when the Trigger Type option is set to Pulse and you select the Set Pulse Width option</td>
</tr>
</tbody>
</table>

**SET TO 50% Button.** Use the SET TO 50% button to quickly stabilize a waveform. The oscilloscope automatically sets the Trigger Level to be about halfway between the minimum and maximum voltage levels. This is useful when you connect a signal to the EXT TRIG BNC and set the trigger source to Ext or Ext/5.
FORCE TRIG Button. Use the FORCE TRIG button to complete the current waveform acquisition whether or not the oscilloscope detects a trigger. This is useful for SINGLE SEQ acquisitions and Normal trigger mode. (In Auto trigger mode, the oscilloscope automatically forces triggers periodically if it does not detect a trigger.)

TRIG VIEW Button. Use the Trigger View mode to have the oscilloscope display the conditioned trigger signal. You can use this mode to see the following types of information: effects of the Trigger Coupling option, AC Line trigger source, and the signal connected to the EXT TRIG BNC.

NOTE. This is the only button that you must hold down to use. When you hold down the TRIG VIEW button, the only other button you can use is the PRINT button. The oscilloscope disables all other front-panel buttons. The knobs continue to be active.
Holdoff. You can use the Trigger Holdoff function to produce a stable display of complex waveforms, such as pulse trains. Holdoff is the time between when the oscilloscope detects one trigger and when it is ready to detect another. The oscilloscope will not trigger during the holdoff time. For a pulse train, you can adjust the holdoff time so the oscilloscope triggers only on the first pulse in the train.

To use Trigger Holdoff, push the HORIZ MENU button and set the Trig Knob option to Holdoff. The USER SELECT LED lights to indicate the alternative function. Turn the knob to adjust the holdoff.
Utility

Push the UTILITY button to display the Utility Menu. The Utility Menu changes with the addition of a TDS2CMA extension module. Refer to the next section for information on the extension module.

</tr>
</tbody>
</table>

* Available only on TDS1000-series oscilloscopes.

** Available only with a TDS2CMA module installed.
Key Points

Self Calibration. The self calibration routine optimizes the oscilloscope accuracy for the ambient temperature. For maximum accuracy, you should perform a self cal if the ambient temperature changes by 5°C or more. Follow the directions on the screen.

System Status

Selecting System Status from the Utility Menu displays the menus available for obtaining a list of control settings for each group of oscilloscope controls.

Push any front-panel menu button to remove the status screen.

<table>
<thead>
<tr>

</tbody>
</table>

*Bandwidth is reduced to 7 MHz with a 1X probe.*
NOTE. The oscilloscope vertical response rolls off slowly above its bandwidth (60 MHz, 100 MHz, or 200 MHz, depending on the model, or 20 MHz when the Bandwidth Limit option is set to On). Therefore, the FFT spectrum can show valid frequency information higher than the oscilloscope bandwidth. However, the magnitude information near or above the bandwidth will not be accurate.

Knobs

VERTICAL POSITION Knobs. Use the VERTICAL POSITION knobs to move the channel waveforms up or down on the screen.

VOLTS/DIV Knobs. Use the VOLTS/DIV knobs to control how the oscilloscope amplifies or attenuates the source signal of channel waveforms. When you turn a VOLTS/DIV knob, the oscilloscope increases or decreases the vertical size of the waveform on the screen with respect to the ground level.

Key Points

GND Coupling. Use GND coupling to display a zero-volt waveform. Internally, the channel input is connected to a zero-volt reference level.

Fine Resolution. The vertical scale readout displays the actual Volts/Div setting while in the fine resolution setting. Changing the setting to coarse does not change the vertical scale until the VOLTS/DIV control is adjusted.
**U in Level and Delta Readouts.** Vertical sensitivity should match on waveforms used for math operations. If they do not match, and you use cursors to measure the waveform result of a math operation, a U displays that represents unknown units or scaling.

**Remove Waveform.** To remove a waveform from the display, push the menu button for the channel to display its vertical menu. Push the menu button again to remove the waveform.

---

**NOTE.** You do not have to display a channel waveform to use it as a trigger source or for math operations.
Math FFT

This chapter contains detailed information on how to use the Math FFT (Fast Fourier Transform). You can use the FFT Math mode to convert a time-domain (YT) signal into its frequency components (spectrum). You can use the Math FFT mode to view the following types of signals:

- Analyze harmonics in power lines
- Measure harmonic content and distortion in systems
- Characterize noise in DC power supplies
- Test impulse response of filters and systems
- Analyze vibration

To use the Math FFT mode, you need to perform the following tasks:

- Set up the source (time-domain) waveform
- Display the FFT spectrum
- Select a type of FFT window
- Adjust the sample rate to display the fundamental frequency and harmonics without aliasing
- Use zoom controls to magnify the spectrum
- Use cursors to measure the spectrum
Setting Up the Time-Domain Waveform

Before you use FFT mode, you need to set up the time-domain (YT) waveform. To do so, follow these steps:

1. Push AUTOSET to display a YT waveform.

2. Turn the VERTICAL POSITION knob to move the YT waveform to the center vertically (zero divisions).
   
   This ensures that the FFT will show a true DC value.

3. Turn the HORIZONTAL POSITION knob to position the part of the YT waveform that you want to analyze in the center eight divisions of the screen.
   
   The oscilloscope calculates the FFT spectrum using the center 2048 points of the time-domain waveform.

4. Turn the VOLTS/DIV knob to ensure that the entire waveform remains on the screen. The oscilloscope may display erroneous FFT results (by adding high frequency components) if the entire waveform is not visible.

5. Turn the SEC/DIV knob to provide the resolution you want in the FFT spectrum.

6. If possible, set the oscilloscope to display many signal cycles.
   
   If you turn the SEC/DIV knob to select a faster setting (fewer cycles), the FFT spectrum shows a larger frequency range, and reduces the possibility of FFT aliasing, described on page 122. However, the oscilloscope also displays less frequency resolution.
To set up the FFT display, follow these steps:

1. Push the MATH MENU button.
2. Set the Operation option to FFT.
3. Select the Math FFT Source channel.

In many cases, the oscilloscope can produce a useful FFT spectrum even if the YT waveform is not triggered. This is especially true if your signal is periodic or random (noisy).

**NOTE.** Transient or burst waveforms should be triggered and positioned as close as possible to center screen.

**Nyquist Frequency**

The highest frequency that any real-time digitizing oscilloscope can measure without errors is one-half the sample rate. This frequency is called the Nyquist frequency. Frequency information above the Nyquist frequency is undersampled which causes FFT aliasing, described on page 122.

The math function transforms the center 2048 points of the time-domain waveform into an FFT spectrum. The resulting FFT spectrum contains 1024 points that go from DC (0 Hz) to the Nyquist frequency.
Normally, the display compresses the FFT spectrum horizontally into 250 points, but you can use the FFT Zoom function to expand the FFT spectrum to more clearly see the frequency components at each of the 1024 data points in the FFT spectrum.

**NOTE.** The oscilloscope vertical response rolls off slowly above its bandwidth (60 MHz, 100 MHz, or 200 MHz, depending on the model, or 20 MHz when the Bandwidth Limit option is set to ON). Therefore, the FFT spectrum can show valid frequency information higher than the oscilloscope bandwidth. However, the magnitude information near or above the bandwidth will not be accurate.

**Displaying the FFT Spectrum**

Push the MATH MENU button to display the Math Menu. Use the options to select the Source channel, Window algorithm, and FFT Zoom factor. You can display only one FFT spectrum at a time.
### Math FFT option

<table>

</tr>
</tbody>
</table>

*Available only on 4-channel oscilloscopes.*

---

1. Frequency at the center graticule line
2. Vertical scale in dB per division (0 dB = 1 $V_{RMS}$)
3. Horizontal scale in frequency per division
4. Sample rate in number of samples per second
5. FFT window type
Selecting an FFT Window

Windows reduce spectral leakage in the FFT spectrum. The FFT assumes that the YT waveform repeats forever. With an integral number of cycles (1, 2, 3, ...), the YT waveform starts and ends at the same amplitude and there are no discontinuities in the signal shape.

A non-integral number of cycles in the YT waveform causes the signal start and end points to be at different amplitudes. The transitions between the start and end points cause discontinuities in the signal that introduce high-frequency transients.
Applying a window to the YT waveform changes the waveform so that the start and stop values are close to each other, reducing the discontinuities.
The Math FFT function includes three FFT Window options. There is a trade-off between frequency resolution and amplitude accuracy with each type of window. What you want to measure and your source signal characteristics help you to determine which window to use.

<table>
<thead>
<tr>
<th>Window</th>
<th>Measure</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hanning</td>
<td>Periodic waveforms</td>
<td>Better frequency, poorer magnitude accuracy than Flattop</td>
</tr>
<tr>
<td>Flattop</td>
<td>Periodic waveforms</td>
<td>Better magnitude, poorer frequency accuracy than Hanning</td>
</tr>
<tr>
<td>Rectangular</td>
<td>Pulses or transients</td>
<td>Special-purpose window for waveforms that do not have discontinuities. This is essentially the same as no window</td>
</tr>
</tbody>
</table>

**FFT Aliasing**

Problems occur when the oscilloscope acquires a time-domain waveform containing frequency components that are greater than the Nyquist frequency (refer to *Nyquist Frequency* on page 117). The frequency components that are above the Nyquist frequency are undersampled, appearing as lower frequency components that “fold back” around the Nyquist frequency. These incorrect components are called aliases.
Eliminating Aliases

To eliminate aliases, try the following remedies:

- Turn the SEC/DIV knob to set the sample rate to a faster setting. Since you increase the Nyquist frequency as you increase the sample rate, the aliased frequency components should appear at their proper frequency. If too many frequency components are shown on the screen, you can use the FFT Zoom option to magnify the FFT spectrum.
If you do not need to view frequencies components above 20 MHz, set the Bandwidth Limit option to On.

Put an external filter on the source signal to bandwidth limit the source waveform to frequencies below that of the Nyquist frequency.

Recognize and ignore the aliased frequencies.

Use zoom controls and the cursors to magnify and measure the FFT spectrum.

**Magnifying and Positioning an FFT Spectrum**

You can magnify and use cursors to take measurements on the FFT spectrum. The oscilloscope includes an FFT Zoom option to magnify horizontally. To magnify vertically, you can use the vertical controls.

**Horizontal Zoom and Position**

The FFT Zoom option lets you horizontally magnify the FFT spectrum without changing the sample rate. Zoom factors are X1 (default), X2, X5, and X10. At zoom factor X1, and with the waveform centered in the graticule, the left graticule line is at 0 Hz and the right graticule line is at the Nyquist frequency.
When you change the zoom factor, the FFT spectrum is magnified about the center graticule line. In other words, the axis of horizontal magnification is the center graticule line.

Turn the HORIZONTAL POSITION knob clockwise to move the FFT spectrum to the right. Push the SET TO ZERO button to position the center of the spectrum at the center of the graticule.

**Vertical Zoom and Position**

The channel vertical knobs become zoom and position controls for their respective channels when displaying the FFT spectrum. The VOLTS/DIV knob provides zoom factors of X0.5, X1 (default), X2, X5, and X10. The FFT spectrum is vertically magnified about the M marker (math waveform reference point on the left edge of the screen).

Turn the VERTICAL POSITION knob clockwise to move the spectrum up.
Measuring an FFT Spectrum Using Cursors

You can take two measurements on FFT spectrums: magnitude (in dB) and frequency (in Hz). Magnitude is referenced to 0 dB, where 0 dB equals 1 V_{RMS}. You can use the cursors to take measurements at any zoom factor.

Push CURSOR \( \gg \) Source and select Math. Push the Type option button to select between Magnitude and Frequency. Use the Vertical Position knobs to move cursors 1 and 2.

Use horizontal cursors to measure magnitude and vertical cursors to measure frequency. The options display the delta between the two cursors, the value at cursor 1 position, and the value at cursor 2 position. Delta is the absolute value of cursor 1 minus cursor 2.

![Magnitude cursors](image1.png)  ![Frequency cursors](image2.png)

You can also take a frequency measurement. To do so, turn the Horizontal Position knob to position a frequency component on the center graticule line and read the frequency at the top right of the display.
TDS2CMA Communications Module

This chapter describes how to use the TDS2CMA Communications Extension Module (optional) with a TDS1000- or TDS2000-series oscilloscope. The TDS2CMA module adds Centronics, RS-232 and GPIB communication ports to the oscilloscope. For ordering information, refer to page 169.

This chapter describes how to do the following tasks:
- Install the extension module
- Set up and test the RS-232 interface
- Set up and test the GPIB interface
- Send screen data to an external device (printer or computer)

Installing and Removing an Extension Module

This section describes how to safely remove and install an extension module on your oscilloscope.
CAUTION. Electrostatic discharge (ESD) can damage components in the module and the oscilloscope. To prevent ESD, follow the next list of precautions when installing, removing, or handling an module.

After removing a module, install the dummy module cover to protect the contact pins.

- Always power down the oscilloscope before removing or installing the module.
- Handle the module as little as possible.
- Transport and store the module in a static-protected bag or container.
- Do not slide the module over any surface.
- Wear a grounded antistatic wrist strap to discharge the static voltage from your body while installing or removing a module from the oscilloscope.
- Do not touch the oscilloscope module connector pins.
- Do not use any devices capable of generating or holding a static charge in the work area where you install or remove the module.
- Avoid handling the module in areas that have a floor or work-surface covering capable of generating a static charge.
- Make sure that you install the module cover after you remove the module.
Removing an Extension Module

To remove an extension module, refer to the next illustration and follow the previous precautions.

Installing an Extension Module

Make sure that you align the module tabs to the oscilloscope connector pins and press down firmly to seat the module.
Checking Module Installation

To check that the module is correctly installed, power on the oscilloscope. The power-on screen should list the TDS2CMA module and include the message “Power-up Tests Passed.” If the oscilloscope does not recognize the module at power on, follow the steps in Troubleshooting Module Installation.

Troubleshooting Module Installation

If the oscilloscope does not recognize the module at power on, follow these steps:

1. Power off the oscilloscope.
2. Follow the ESD precautions on page 128.
3. Disconnect all cables from the module.
4. Remove the module as described on page 129.
5. Examine the oscilloscope connector for bent, broken, or missing pins. If any pins are bent, carefully straighten them.
6. Reinstall the module onto the oscilloscope.
7. Power on the oscilloscope. If the oscilloscope still does not show the module installed, contact the nearest Tektronix service center.
Sending Screen Data to an External Device

The TDS2CMA module lets you send screen data to an external device, such as a controller, printer, or computer.

Printer Setup

To setup the module, do the following:

1. Power on the oscilloscope.

2. Push UTILITY ► Options ► Printer Setup.

3. Push the option buttons to change the settings to match those of your printer. The next table lists the settings you can change.

NOTE. The oscilloscope stores these settings until you change them, even if you push the DEFAULT SETUP button.
<table>
<thead>
<tr>

</tbody>
</table>

* Only for TDS2000-series oscilloscopes.

**NOTE.** If you use the RS-232 or GPIB port, you also need to set up the parameters for the port appropriately for your printer.
**Testing the Printer Port**

To test the printer port, follow these steps:

1. If you have already connected the oscilloscope to a printer, go to step 4.
2. Power off the oscilloscope and the printer.
3. Connect the oscilloscope to the printer using the appropriate cable.
4. Power on the oscilloscope and the printer.
5. If you have not done so already, define an appropriate printer setup. Refer to page 131.
6. Push the **PRINT** button. The printer should begin printing a copy of the oscilloscope screen within twenty seconds, depending on the selected printer.

**Printing Oscilloscope Screen Data**

To print the screen data, push the **PRINT** button. The oscilloscope takes a few seconds to capture the screen data. The settings of your printer and print speed determine how long it takes to print the data. Additional time may be required according to the format selected.

---

*NOTE. You can use the oscilloscope while the printer prints.*
Setting Up and Testing the RS-232 Interface

You may need to set up and test the module RS-232 interface. RS-232 is an 8-bit serial communications standard that lets the oscilloscope communicate with an external RS-232 device such as a computer, terminal, or printer. The standard defines two device types: Data Terminal Equipment (DTE) and Data Communications Equipment (DCE). The oscilloscope is a DTE device.

*RS-232 Conventions* on page 141 describes RS-232 conventions. *RS-232 Connector Pinout Diagram* on page 142 shows a diagram of the 9-pin RS-232 connector with pin numbers and signal assignments.

Selecting an RS-232 Cable

You need an RS-232 cable to connect the oscilloscope to an external device. You can use the next table to choose the correct cable.

<table>
<thead>
<tr>
<th>To connect the oscilloscope to</th>
<th>You need this type cable</th>
<th>Tektronix part number</th>
</tr>
</thead>
<tbody>
<tr>
<td>PC/AT or laptop computers</td>
<td>9-pin female to 9-pin female, null modem</td>
<td>012-1379-00</td>

<td>9-pin female to 25-pin male, modem</td>
<td>012-1241-00</td>
</tr>
</tbody>
</table>
Connecting an External Device

When you connect the module to an external RS-232 device, follow these guidelines:

- Use the correct cable (refer to the table on page 134).
- Use a cable that is no longer than 50 feet.
- Power off the oscilloscope and the external device before you connect the cable between them.
- Connect the oscilloscope only to a DCE device.
- Check that the oscilloscope signal ground (pin 5) is connected to the external device signal ground.
- Connect the chassis ground of the oscilloscope to the chassis ground of the external device.
RS-232 Settings

To set up the oscilloscope RS-232 interface, follow these steps:

1. Push **UTILITY** ► **Options** ► **RS-232**.

2. Push the option buttons to match the settings of your external device. The next table lists the settings you can change.

**NOTE.** The oscilloscope stores these settings until you change them, even if you push the DEFAULT SETUP button.

<table>
<thead>
<tr>

</tbody>
</table>
Testing the RS-232 Interface

To test the oscilloscope RS-232 interface, follow these steps:

1. Connect the oscilloscope to a personal computer (PC) using an appropriate RS-232 cable (refer to the table on page 134).

2. Power on the PC.

3. On the PC, run a terminal-emulator program such as Microsoft Windows Hyperterminal. Make sure the PC serial port is set as follows:

<table>
<thead>
<tr>
<th>Function</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td>9600</td>
</tr>
<tr>
<td>Data flow control</td>
<td>hardflagging</td>
</tr>
<tr>
<td>Parity</td>
<td>None</td>
</tr>
</tbody>
</table>

4. Power on the oscilloscope.

5. Connect the oscilloscope probe to the channel 1 input connector. Attach the probe tip and ground lead to the PROBE COMP connectors.

The PROBE COMP signal is a square wave with a frequency of ≈1 kHz and a peak voltage of ≈5 V. The next figure shows how to connect the probe to the oscilloscope.

7. Check that the menu settings match those listed in the table on page 137.

8. From your PC terminal program, type ID?, then press the Return or Enter key to send the command. The oscilloscope sends back its identification string, which should look similar to the following:

   ID TEK/TDS 1002,CF:91.1CT,FR:V1.09 TDS2CMA:CMV:V1.04

   If you do not get any response, refer to the troubleshooting steps that start on page 139.

9. Send the command FACTory to reset the oscilloscope to factory settings (defaults).
NOTE. For brief information on command entry, refer to page 150.

For complete command information, refer to the programmer manual that came with your extension module.

10. Send the command AUTOSet EXECute to have the oscilloscope automatically acquire the input signal.

11. Send the command MEASUrement:IMMed:SOURCE CH1 to select measurements on channel 1.

12. Send the command MEASUrement:IMMed:TYPe PK2 to set up the voltage measurement.

13. Send the query MEASUrement:IMMed:VALue? to request the measurement result. The oscilloscope will respond with a result similar to 5.16E0, which is the voltage measurement of the PROBE COMP signal using the standard 10X probe.

This completes the RS-232 interface test.

RS-232 Troubleshooting

If the oscilloscope and the external device (computer or printer) have trouble communicating, follow these steps:

1. Verify that the module is working. Refer to Checking Module Installation on page 130.
2. Check that you are using the correct RS-232 cable. Determine whether your external device requires a null-modem or a straight-through connection. Refer to the table on page 134 for information about RS-232 cables.

3. Check that the RS-232 cable is firmly connected to both the oscilloscope and the correct port on the external device.

4. Check that the printer or the program on the personal computer is using the same port to which you connected the RS-232 cable. Try your program or printer again.

5. Check that the oscilloscope RS-232 settings match the settings used by the external device:
   a. Determine the RS-232 settings for the external device.
   b. On the oscilloscope, push **UTILITY** ➤ **Options** ➤ **RS-232 Setup**.
   c. Set the oscilloscope to match the settings of the external device.
   d. Try your terminal-emulator program or printer again.

6. Try setting both the oscilloscope and the external device to a slower baud rate.
7. If you receive only part of the printer file, try these remedies:

   a. Lengthen the timeout for the external device
   b. Make sure the printer is set to receive a binary file, not a text file.

RS-232 Conventions
There are processing conventions that are specific to the RS-232 interface, such as transferring binary data, processing break signals, reporting RS-232 I/O errors, and checking command status.

Transferring Binary Data
To use the RS-232 port to transfer binary data to the oscilloscope, set up the interface as follows:

   - Use hardware flagging (RTS/CTS) whenever possible. Hardware flagging guarantees no data loss.

   - All eight bits of binary data contain meaningful information. To make sure that all eight bits are received or transmitted, configure the external RS-232 device to receive and transmit eight-bit characters (set the RS-232 word length to eight bits).

Reporting RS-232 I/O Errors
Errors are reported when there is a problem with parity, framing, or input/output buffer overruns. To report errors, the oscilloscope posts an event code. When an error occurs, the oscilloscope discards all input and output and waits for a new command.
Checking Command Status
If you want to check the status of each command sent, you can append an *STB? query after every command and read the response string.

Processing Break Signals
When the oscilloscope senses a break signal on the RS-232 port, it returns DCL followed by the end of line terminator. Internally, the oscilloscope acts as if it received a GPIB <DCL> command, causing the oscilloscope to erase the contents of the input and output buffers and then wait for a new command. Break signals do not change oscilloscope settings or stored data and do not interrupt front-panel operation or nonprogrammable functions.

If a break signal is sent in the middle of a character stream, several characters immediately preceding or following the break can be lost. The controller should wait until it receives the DCL and the end of line terminator string before sending more characters.

RS-232 Connector Pinout Diagram
The next figure shows the pin numbering and signal assignments for the TDS2CMA RS-232 connector.

### Setting Up and Testing the GPIB Interface

You may need to set up and test the module GPIB interface. GPIB is an 8-bit parallel communications standard that lets the oscilloscope communicate with an external device such as a controller, computer, terminal, or printer.

**Connecting to External GPIB Devices**

Follow these guidelines when you connect your oscilloscope to a GPIB network:

- Power off the oscilloscope and all external devices before connecting the oscilloscope to the GPIB network.
- Connect the oscilloscope to the GPIB network. Use an appropriate GPIB cable. You can stack cable connectors. The next table lists cables that you can order to connect the oscilloscope to the GPIB network.

<table>
<thead>
<tr>
<th>Cable type</th>
<th>Tektronix part number</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIB, 6.6 feet (2 meters)</td>
<td>012-0991-00</td>
</tr>
<tr>
<td>GPIB, 3.3 feet (1 meter)</td>
<td>012-0991-01</td>
</tr>
</tbody>
</table>

- Assign a unique device address to the oscilloscope. No two devices can share the same device address. The *GPIB Settings* information describes how to set the oscilloscope GPIB interface.

- Power on at least two-thirds of the GPIB devices while using the network.

**GPIB Settings**
To set the oscilloscope GPIB interface, follow these steps:

1. If you have not done so yet, connect the oscilloscope to the GPIB network.
2. On the oscilloscope, push **UTILITY ▶ Options ▶ GPIB Setup**.

3. Push the **Address** option button to assign a unique address to the oscilloscope.

4. Push the **Bus Connection** option button to have the oscilloscope start or stop using the GPIB bus.

<table>
<thead>
<tr>
<th>Option</th>
<th>Settings</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>0... 30</td>
<td>Sets oscilloscope GPIB bus address</td>
</tr>
<tr>
<td>Bus Connection</td>
<td>Talk-Listen, Off-Bus</td>
<td>Select Talk-Listen to start oscilloscope GPIB bus communications. Select Off-Bus to stop oscilloscope GPIB bus communications.</td>
</tr>
</tbody>
</table>

**NOTE.** The oscilloscope stores these settings until you change them, even if you push the **DEFAULT SETUP** button.

**Testing the GPIB Interface**

To test the oscilloscope GPIB interface, you will need to refer to the documentation that came with your controller.
The following procedure verifies communication with the oscilloscope by acquiring a signal and returning a voltage measurement. This procedure assumes that the oscilloscope is connected to the GPIB network, the oscilloscope has been assigned a unique bus address, and that the controller software is running.

To test the GPIB interface, follow these steps:

1. Connect the oscilloscope probe to the channel 1 input connector. Attach the probe tip and ground lead to the PROBE COMP connectors. The figure on the next page shows how to hook up the probe to the oscilloscope.

The PROBE COMP signal is a square wave with a frequency of \( \approx 1 \) kHz and a peak voltage of \( \approx 5 \) V.
2. In the controller software, send the ID? command to the oscilloscope. The oscilloscope should send back its identification string which looks similar to the following:

   ID TEK/TDS 1002,CF:91.1CT,FV:V1.09 TDS2CMA:CMV:V1.04

3. Send the command FACTory to reset the oscilloscope to factory settings (defaults).

   **NOTE.** For brief information on command entry, refer to page 150.

   For complete command information, refer to the programmer manual that came with your extension module.

4. Send the command AUTOSet EXECute to have the oscilloscope automatically acquire the input signal.

5. Send the command MEASurement:IMMed:SOURCE CH1 to select measurements on channel 1.

6. Send the command MEASurement:IMMed:TYPe PK2 to set up the voltage measurement.

7. Send the query MEASurement:IMMed:VALue? to request the measurement result. The oscilloscope will respond with a result similar to 5.16E0, which is the voltage measurement of the PROBE COMP signal using the standard 10x probe.

This completes the GPIB interface test.
**GPIB Network Conventions**

To achieve a high data transfer rate, the physical distance between devices and the number of devices on the bus are limited. When you create the GPIB network, follow these guidelines:

- Connect the GPIB devices in a star, linear, or combination star/linear network.

---

**CAUTION.** *Do not use loop or parallel networks.*

---
- A maximum separation of 13.2 feet (4 meters) between any two devices and an average separation of 6.6 feet (2 meters) over the entire bus.

- A maximum total cable length of 66 feet (20 meters).

- No more than 15 device loads connected to each bus, with at least two-thirds powered on.

- Assign a unique device address to each device on the network. No two devices can share the same device address.
Command Entry

When you enter oscilloscope commands over the RS-232 or GPIB bus, follow these general rules:

- You can enter commands in upper or lower case.
- You can abbreviate many oscilloscope commands. These abbreviations are shown in uppercase letters. For example, the command ACQuire:NUMAVg can be entered simply as ACQ:NUMAV or acq:numav.
- You can precede any command with white space characters. White space characters include any combination of the ASCII control characters 00 through 09 and 0B through 20 hexadecimal (0 through 9 and 11 through 32 decimal).
- The oscilloscope ignores commands that consist of just a combination of white space characters and line feeds.

Refer to the TDS200-, TDS1000- and TDS2000-Series Digital Oscilloscope Programmer Manual (071-1075-XX) for more information.
Appendix A: Specifications

All specifications apply to the TDS1000- and TDS2000-series oscilloscopes. P2200 probe specifications appear at the end of this chapter. To verify that the oscilloscope meets specifications, the oscilloscope must first meet the following conditions:

- The oscilloscope must have been operating continuously for twenty minutes within the specified operating temperature.
- You must perform the Do Self Cal operation, accessible through the Utility menu, if the operating temperature changes by more than 5°C.
- The oscilloscope must be within the factory calibration interval

All specifications are guaranteed unless noted “typical.”

  The Frequency Counter measures trigger source at all times, including when the oscilloscope acquisition is halted due to changes in the run status, or acquisition of a single shot event has completed.

  Pulse Width Trigger mode: The oscilloscope counts pulses of significant magnitude inside the 250 ms measurement window that qualify as triggerable events, such as narrow pulses in a PWM pulse train if set to < mode and the width is set to a relatively small time.

  Edge Trigger mode: The oscilloscope counts all edges of sufficient magnitude and correct polarity.

  Video Trigger mode: The Frequency Counter does not operate.

¹ Emissions that exceed the levels required by this standard may occur when this equipment is connected to a test object.

² To ensure compliance to the standards listed above, attach only high quality shielded cables to this instrument. High quality shielded cables typically are braid and foil types that have low impedance connections to shielded connectors at both ends.

³ The increase in trace noise while subjected to a test field (3 V/m over the frequency range 80 MHz to 1 GHz, with 80% amplitude modulation at 1 kHz) is not to exceed 2 major divisions peak-to-peak. Ambient conducted fields may induce triggering when the trigger threshold is offset less than 1 major division from ground reference.

⁴ The increase in trace noise while subjected to a test field (3 V/m over the frequency range 150 kHz to 80 MHz, with 80% amplitude modulation at 1 kHz) is not to exceed 1 major division peak-to-peak. Ambient conducted fields may induce triggering when the trigger threshold is offset less than 0.5 major divisions from ground reference.

</tbody>
</table>

300 V_{RMS}, Installation Category II; derate at 20 dB/decade above 900 kHz to 13 V peak AC at 3 MHz and above. For non-sinusoidal waveforms, peak value must be less than 450 V. Excursion above 300 V should be less than 100 ms duration. RMS signal level including any DC component removed through AC coupling must be limited to 300 V. If these values are exceeded, damage to the instrument may result. Refer to the Overvoltage Category on the next page.

1 As defined in EN61010-1 on the next page.

</tr>
</tbody>
</table>

Soft Case. The soft case (AC220) protects the instrument from damage and provides space for probes, power cord, and manuals.

Transit Case. The transit case (HCTDS32) provides shock, vibration, impact and moisture protection for the instrument when you transport it from one place to another. The required soft case fits inside the transit case.
Appendix C: General Care and Cleaning

General Care

Do not store or leave the instrument where the LCD display will be exposed to direct sunlight for long periods of time.

CAUTION. To avoid damage to the instrument or probes, do not expose them to sprays, liquids, or solvents.

Cleaning

Inspect the instrument and probes as often as operating conditions require. To clean the exterior surface, perform the following steps:

1. Remove loose dust on the outside of the instrument and probes with a lint-free cloth. Use care to avoid scratching the clear plastic display filter.

2. Use a soft cloth dampened with water to clean the instrument. Use an aqueous solution of 75% isopropyl alcohol for more efficient cleaning.

CAUTION. To avoid damage to the surface of the instrument or probes, do not use any abrasive or chemical cleaning agents.
## Appendix D: Default Setup

This appendix describes the options, buttons and controls that change settings when you push the DEFAULT SETUP button. For a list of settings that do not change, refer to page 178.

**NOTE.** When you push the DEFAULT SETUP button, the oscilloscope displays the CH1 waveform and removes all other waveforms.
