

## Placement Exam August 2010

Dates: Friday, Aug 27, 10:00-12:00 Classical Mechanics  
13:30-15:30 E&M and E&M I  
Monday, Aug 30, 10:00-12:00 QM and QMI  
13:30-15:30 Thermo/Stat Mech  
Tuesday, Aug 31, 10:00-12:00 E&M II

Location – TBA

Each day you will be given exams for the subjects listed. Part A for E&M, Classical Mech, Quantum Mech, and Thermo/Stat Mech will cover material at the undergraduate level. The purpose is to determine your understanding of the essential physics required to begin the graduate courses and to identify weaknesses in your preparation. Depending on your performance, you may be advised to repeat the appropriate undergraduate course or courses. Part B tests material at the graduate level. If you wish to place out of one of the core graduate courses you need to pass Part B of the appropriate exam. Astro students do need to complete Part A of Thermo/Stat Mech, but do not need to do Part B of either Thermo/Stat Mech or QM II, which are not taken in the astro sequence. The placement exam for astro courses and QM II, will be offered in December. We will probably offer Stat Mech B and EMII in December again if there is a need to.

You will pick up whichever part of the exam you wish to take. If you take Part B, and after looking it over decide it is too difficult, you can exchange it for Part A. The exams will be closed book, but you may bring one 8.5 x 11 inch sheet of paper with whatever you want written on it for each topic. You will be given a formula sheet with integrals, physical constants, Clebsch-Gordon coefficients, spherical harmonics, etc. that may be needed on the exam.

The following pages outline the material to be covered by the exam.

For undergraduate courses, the material has been divided into very basic, intermediate, and advanced. Basic topics are those that are generally covered in an introductory sequence (or sophomore/junior level “modern physics” type course for QM), and we would expect you to know well. Intermediate topics are those covered in typical sophomore/junior level courses and we would expect you to know well and be able to work reasonable problems on those topics. Advanced topics are those that you should have familiarity with, and we would expect you to be able to answer some questions. For graduate courses we would expect you to have good familiarity with the advanced undergraduate topics as well as the additional topics listed.

## Undergraduate Mechanics – Suggested text Classical Mechanics, Taylor

### I. Basic

Vector algebra: addition, dot and cross products, scalar multiplication, components  
Kinematics: displacement, velocity, acceleration, units, Newton's laws.  
Rolling, angular velocity and acceleration.  
Static equilibrium, forces and torques.  
Force and torque balance in compound problems, and with constant  
(linear and circular) acceleration. Free body diagrams.  
Momentum, impulse. Collisions, elastic and inelastic.  
Work and Energy, integral along path, conservative forces. Potential energy, power.  
Determine motion: ballistic, constant forces with friction,  
Apply conservation laws: momentum, angular momentum, energy  
Newton's law of gravity, Kepler's laws  
Rotational motion about a fixed axis. Center of mass, Torque, moment  
of inertia. Rolling motion. Angular momentum of particles and rigid bodies.  
Simple harmonic motion, including damping and driven oscillations  
The pendulum (small oscillations)  
Wave motion on string, boundary conditions, wave number, phase. Wave  
fronts, power and intensity. Standing waves, reflection and transmission  
Fluids: pressure, density, buoyancy, equation of continuity,  
Bernoulli's eq. Young's modulus and Bulk modulus  
Springs, Hooke's law.  
Doppler effect

### II. Intermediate

Vectors and their derivatives in polar and spherical coords.  
Projectile motion with air resistance.  
Charged particle motion in constant B field.  
Rocket equation of motion. Systems of particles.  
Potential and its gradient.  
Momentum and Angular momentum and angular velocity as vectors, Moment of inertia tensor  
and center of mass from integrals.  
Solution of general 1-D potential problems. Two-body central force  
problem. Kepler's laws, including ellipse.  
Oscillations, including damped driven harmonic oscillator, Q, fourier  
series, Parseval's theorem.  
Non-inertial reference frames --- linearly accelerating; rotating.  
Centrifugal and Coriolis forces. Foucault pendulum. Accel in rotating  
frame.  
Calculus of variations, shortest path, Fermat's principle, Euler-Lagrange equations, Hamilton's  
princ. generalized forces and momentum,  
Constrained systems, Lagrange multipliers.  
Rigid body motion: inertia tensor and principle axes, Euler's  
equations, torque-free motion near principle axes, or for axially symmetric body. Euler angles,  
spinning top.  
Kinematics of elastic and inelastic collisions  
Small oscillations about static equilibrium, general case

Relativity: Galilean. Special Rel postulates. events. simultaneity, time dilation, length contraction, 1-D velocity addition. momentum, relativistic energy, mass-energy conversion

### III. Advanced

Hamiltonian Mechanics. state space, generalized momentum, phase space hamilton's equations, ignorable coords, phase space orbits, Liouville's theorem

Collision theory: scattering angle, impact parameter, cross section  $D\sigma/d\Omega$ , Rutherford scat. CM vs lab.

Special relativity: twin paradox, Lorentz transformations, space-time, 4-vectors, scalar product, light cone, light- and time-like vectors,

Doppler shift, mass, 4-velocity, momentum and energy. Threshold energies. tensors and  $F^{\mu\nu}$  transform of E, B.

## **Undergraduate E&M Suggested text – Introduction to Electrodynamics, Griffiths**

### I. Basic

Coulomb's law  
Continuous charge distributions  
Electric fields and electrostatic potentials  
Gauss's law  
Work and energy  
Capacitors  
Electric dipoles  
Magnetostatics and Lorentz force  
Biot-Savart law  
Ampere's law  
Ohm's law  
Electromagnetic induction  
Electromotive force, motional emf  
Faraday's law  
Induced charges, surface charges on conductors  
Fields inside cavities in conductors  
EM waves in vacuum  
Basic electrical circuits

### II. Intermediate

Laplace's equation  
Method of images  
Separation of variables  
Multipole expansion  
Electric fields in matter  
P, D, and linear dielectrics  
Continuity equation  
Curl and divergence of B  
Mutual inductance, self-inductance  
The vector potential  
Magnetic dipoles  
Magnetic fields in matter  
Maxwell's equations, displacement current  
Maxwell's equations in matter  
EM waves in matter  
EM waves in conductors  
Absorption, reflection, and dispersion of EM waves  
Wave guides  
Dipole radiation

### III. Advanced

Energy, momentum, and angular momentum of EM field

Poynting's theorem

Maxwell stress tensor

Conservation laws

Potentials and gauge transformations

Electric and magnetic dipole radiation

Retarded potentials

Radiation from accelerating charges

Relativistic electrodynamics

Tensor formulation of electrodynamics

## Undergraduate QM Suggested text – Introduction to Quantum Mechanics, Griffiths

### I. Basic

Interpretation of wave functions (normalization, expectation values, probabilities, stationary vs. non-stationary states)

Position and momentum operators

Uncertainty principles: position and momentum; time and energy

Eigenvalues and eigenfunctions of an operator given as a matrix

Solving the time-independent Schroedinger equations in 1D

-- Free particles; de Broglie wavelength

-- Infinite square potential well

-- Transmission and reflection from a step potential

Gaussian wavepackets

### II. Intermediate

Solving 1D Schroedinger equation for

-- Delta function potential and barrier

-- Finite square well

-- Harmonic oscillator using wavefunction approach

Harmonic oscillator using raising and lowering operators

Separation of variables for 3D Schrodinger equation for radial potentials

-- Spherical harmonics

-- Particle in a spherical box

-- Hydrogen atom

Angular momentum

Spin, spin-1/2, Pauli matrices, magnetic moment, Stern-Gerlach

Indistinguishable particles (bosons and fermions)

Bose-Einstein, Fermi-Dirac and Maxwell-Boltzmann statistics

Time-independent perturbation theory (elementary)

Stark effect

Variational principle

WKB approximation for tunneling

Free-electron gas model for solids

### III. Advanced

Generalized uncertainty principle

Angular momentum addition and Clebsh-Gordon coefficients

Selection rules

Electron configurations of atoms based on Hund's rules

WKB approximation for a bound state

Time-independent perturbation theory (2nd order, degenerate)

Time-dependent perturbation theory

Charged particle in an electromagnetic field

Scattering theory and Born approximation

Optical theorem

## **Undergraduate Thermodynamics - Suggested Text – Intro to Thermal Physics, Schroeder**

### **I. Basic**

Laws of thermodynamics –definitions  
Temperature scales  
Heat transfer by conduction  
Properties of ideal gas  
Relation between temperature and kinetic energy  
Maxwell distribution  
Work and PV diagrams  
Carnot cycle

### **II Intermediate**

Thermodynamic variables  
Macro and micro states  
Heat Engines and refrigerators  
Thermodynamic potentials  
Kinetic theory  
Phase transitions  
Transport phenomena  
Van der Waals gas

### **III Advanced**

Boltzmann distribution  
Phase transformations in binary mixtures  
Statistics of ideal quantum systems  
Black body radiation  
Bose-Einstein condensation

## **Graduate Classical Mechanics - Suggested text Classical Mechanics, Goldstein**

Lagrangian mechanics, invariance under point transformations, generalized coordinates and momenta, curved configuration space, Phase space, dynamical systems, orbits in phase space, phase space flows, fixed points, stable and unstable, Canonical transformations, poisson brackets, differential forms, Liouville's theorem, the natural symplectic 2-form and generating functions, Hamilton-Jacobi theory. Integrable systems, adiabatic invariants,

Continuum mechanics: taut string and lattice of point masses. 1-D wave equation. boundary conditions, 3-D wave equation,  $\nabla^2$ , plane waves, spherical waves, volume and surface forces, stress and strain, elastic moduli (bulk, shear, Young) stress tensor. Strain tensor. longitudinal and transverse waves in solid. Fluids. "material derivative", inviscid fluid, Bernoulli, eq of continuity. Waves.

field theory: Lagrangian density, Hamilton's principle for fields, cyclic coordinates, Noether's theorem. Lagrangian formulation of electromagnetism.

## **Graduate E&M I - Suggested Text – Electrodynamics, Jackson**

Gauss Law – differential and integral form  
Poisson and Laplace Equations  
Green's Theorem  
Dirichlet and Neumann boundary conditions  
Boundary value problems with cylindrical and spherical symmetry  
Laplace equation in cylindrical and spherical coordinates  
Magnetostatics  
Vector and scalar potentials  
Maxwell's equations  
Plane electromagnetic waves  
Linear and circular polarization

## **Graduate E&M II**

Dipole radiation  
Special Relativity  
Relativistic charged particles in and external magnetic field  
Electromagnetic waves in conducting and dissipative media  
Wave guides and resonant cavities  
Motion in static fields, adiabatic flux invariance  
Lagrangian for the electromagnetic field  
Cherenkov radiation  
Radiation of accelerating point charges, Lienard-Wiechert potentials  
Thomson scattering  
Radiation emitted during collisions, bremsstrahlung

**Graduate QM I - Suggested texts Principles of Quantum Mechanics, Shankar**  
Modern Quantum Mechanics, Sakurai

Vector spaces  
Eigenvalues and eigenvectors  
Position and momentum operators  
Schroedinger equation  
One dimensional potentials  
Harmonic oscillator  
Symmetries in quantum mechanics  
Identical particles  
Translations and rotations in two dimensions  
Hydrogen atom, energy levels, degeneracy  
Spin, Pauli matrices

**Graduate QM II**

Variational methods  
WKB approximation  
Tunneling  
Time independent perturbation theory  
Degenerate perturbation theory  
Scattering theory  
Born approximation  
Partial wave expansion  
Time dependent perturbation theory  
Electromagnetic interactions  
Dirac equation

**Graduate Statistical Mechanics Suggested text - Statistical Physics of Particles, Kardar**

The problem of kinetic theory binary collisions, boltzmann transport, gibbsian ensemble  
Postulate of class. stat mech, microcanonical ensemble, derivation of thermodynamics,  
equipartition theorem, classical ideal gas, Gibbs paradox  
Canonical Ensemble and Grand Canonical Ensemble -Canonical ensemble, energy fluctuations in  
the ensemble, Grand Canonical ensemble, density fluctuation in the GCE, chemical potential  
Postulates of Quantum Stat Mech, density matrix, ensembles in QSM, 3rd law, ideal gas -  
microcanonical ensemble, grand canon. ens., of statis. mech.  
Fermi systems equat. of state of an ideal fermi gas, theory of white dwarf stars, Landau  
diamagnetism, De Haas-Van Alpen effect, quantized hall effect, Pauli paramagnetism, magnetic  
properties of an imperfect gas  
Bose systems –photons, black body radiation, phonons in solids, bose-einstein condensate,  
imperfect bose gas, superfluid order parameter.  
Fluctuation-Dissipation theorem, phase transitions of first and second order

## **Astronomy Suggested text – The physics of stars, Phillips**

### I. Basic

Parallax distance

Apparent & absolute magnitude

Star colors and spectral types

Hertzsprung-Russell diagram - main seq.

Stefan-Boltzmann Law, WDs & red giants

Stellar masses from binaries and rough mass-luminosity relation

Hydrostatic balance in stars

Nuclear energy generation

Post-main sequence evolution (broad outline)

Basic differences between spiral & elliptical galaxies

Hubble expansion

### II. Intermediate

Basic solar/stellar structure (radiative, convective zones)

Isochrones and age dating of star clusters

Stellar populations

Luminosity functions and mass-to-light ratios

Determining gas motions in disk galaxies

The Milky Way - problems getting  $R_0$ ,  $V_0$  and the rotation curve

Rotational balance & mass estimation in disk galaxies

Virial theorem and applications

Mass discrepancies in galaxies & galaxy clusters

Standard candles (Cepheid and SN Ia) as distance indicators

The collisionless nature of stellar systems

### III. Advanced

Eddington (limiting) luminosity

Stellar variability/pulsations

Degeneracy pressure & Chandrasekhar mass

Jeans instability and Jeans mass

Epicycle motion in galaxies

Distance estimation by Tully-Fisher, etc

Distribution functions & collisionless Boltzmann eq

Spiral arm theory

Mass estimation in pressure-supported systems

Gravitational lensing

Solar neutrinos, solar oscillations
