Contents

1 Particle Kinematics **1**

1.1 Introduction 1
1.2 Single Particle Kinematics 3
1.2.1 Motion in configuration space 3
1.2.2 Conserved Quantities 5
1.3 Systems of Particles 9
1.3.1 External and internal forces 9
1.3.2 Constraints 13
1.3.3 Generalized Coordinates for Unconstrained Systems . . 16
1.3.4 Kinetic energy in generalized coordinates 17
1.4 Phase Space 20
1.4.1 Dynamical Systems 21
1.4.2 Phase Space Flows 25

2 Lagrange's and Hamilton's Equations **35**

2.1 Lagrangian for unconstrained systems 36
2.2 Lagrangian for Constrained Systems 39
2.2.1 Some examples of the use of Lagrangians 42
2.3 Hamilton's Principle 44
2.3.1 Examples of functional variation 46
2.4 Conserved Quantities 48
2.4.1 Ignorable Coordinates 48
2.4.2 Energy Conservation 50
2.5 Hamilton's Equations 52
2.6 Don't plug Equations of Motion into the Lagrangian! 54
2.7 Velocity-dependent forces 55

3 Two Body Central Forces **65**
3.1 Reduction to a one dimensional problem 65
3.1.1 Reduction to a one-body problem 65
3.1.2 Reduction to one dimension 67
3.2 Integrating the motion 68
3.2.1 The Kepler problem 70
3.2.2 Nearly Circular Orbits 73
3.3 The Laplace-Runge-Lenz Vector 76
3.4 The virial theorem 77
3.5 Rutherford Scattering 78

4 Rigid Body Motion **85**
4.1 Configuration space for a rigid body 85
4.1.1 Orthogonal Transformations 87
4.1.2 Groups 91
4.2 Kinematics in a rotating coordinate system 93
4.3 The moment of inertia tensor 97
4.3.1 Motion about a fixed point 97
4.3.2 More General Motion 99
4.4 Dynamics 106
4.4.1 Euler's Equations 106
4.4.2 Euler angles 112
4.4.3 The symmetric top 115

5 Small Oscillations **123**
5.1 Small oscillations about stable equilibrium 123
5.1.1 Molecular Vibrations 126
5.1.2 An Alternative Approach 132
5.2 Other interactions 133
5.2.1 Forced Harmonic Oscillations 134
5.3 String dynamics 136
5.4 Field theory 141
5.4.1 Lagrangian density 142
5.4.2 Three dimensional continua 144

6 Hamilton's Equations **155**
6.1 Legendre transforms 155
6.2 Variations on phase curves 160

6.3 Canonical transformations 161
6.4 Poisson Brackets 165
6.5 Higher Differential Forms 170
6.6 The natural symplectic 2-form 178
6.6.1 Generating Functions 181
6.7 Hamilton–Jacobi Theory 190
6.8 Action-Angle Variables 194

7 Perturbation Theory **201**
7.1 Integrable systems 201
7.2 Canonical Perturbation Theory 210
7.2.1 Time Dependent Perturbation Theory 212
7.3 Adiabatic Invariants 214
7.3.1 Introduction 214
7.3.2 For a time-independent Hamiltonian 214
7.3.3 Slow time variation in $H(q, p, t)$ 215
7.3.4 Systems with Many Degrees of Freedom 221
7.3.5 Formal Perturbative Treatment 224
7.4 Rapidly Varying Perturbations 226

8 Field Theory **233**
8.1 Lagrangian Mechanics for Fields 233
8.2 Special Relativity 243
8.3 Noether's Theorem 246
8.3.1 Applications of Noether's Theorem 254
8.4 Examples of Relativistic Fields 256

A Appendices **263**
A.1 ϵ_{ijk} and cross products 263
A.1.1 Vector Operations: δ_{ij} and ϵ_{ijk} 263
A.2 The gradient operator 266
A.3 Gradient in Spherical Coordinates 268
